NDGS Looks at Paleontology Exhibits Across North Dakota, and more!

Association of American State Geologists

The North Dakota Geological Survey July 2016 issue of Geo News is now available. This month they explored the many paleontology exhibits that are available across the state of North Dakota which include a spectacular array of dinosaurs including triceratops, mosasaur, and fossils that harken back to present day North Dakota's swampy past. There is also a story on what a trace fossil is, how LiDAR is used in North Dakota, growth in consulting firms, and challenges posed by the Edinburg Moraine.
