NGWA: Four Steps for Well Owners to Protect Water Wells, Health During Hurricane Flooding

Reprinted from the National Ground Water Association with permission.
(WESTERVILLE, OH — October 5, 2016) The owners of private household water wells in areas threatened by Hurricane Matthew flooding should act to address possible threats to their drinking water quality?, the National Ground Water Association said today.

If a well has been flooded:

- Do not drink the water or wash with it, but use an alternative supply such as bottled water
- Stay away from the well pump while it's flooded to avoid electrical shock
- Get a qualified water well contractor or pump installer to —
    - Clean and turn on the pump
    - Flush the well
    - Disinfect the well
    - Perform any other necessary maintenance
- Check with the local emergency management agency about any guidance relating to local conditions or specific contamination threats due to area flooding.

Bacterial contamination is to be expected in a flooded well, so disinfection of the well system after it has been pumped out and cleaned will be necessary, said Cliff Treyens, NGWA director of general public outreach. NGWA recommends that water well system professionals be used to assess and service the well.

Well owners can search for NGWA-member or NGWA-certified professionals at WellOwner.org under "Finding a Contractor."

Other resources for well owners in flood situations can be found in the "Water Quality?" section of WellOwner.org and in a 10-minute video on well flooding viewable on YouTube.
