

SSSA: Shining the Spotlight on Soil Contamination

Soil Science Society of America

The Soil Science Society of America (SSSA) recently wrote an article based on research published in their journal. Soil contamination is a societal challenge, but adequately testing for contamination is a costly and time intensive process. Using three different portable spectroscopic sensors, a team analyzed soils and compared the results against known standards obtained through wet chemistry to see if the portable sensors could be viable as a quick and cost-effective technique to screen soils.
