EARTH: Here Comes the Solar Maximum

In 1859, the largest recorded coronal mass ejection from the sun, known as the Carrington Event, disrupted what little electrical technology was used at the time. Back then, that meant the temporary disruption of the telegraph system. Today, without an effective warning mechanism in place, a solar storm of that magnitude could wreak havoc on our technology-dependent world. And with the solar maximum predicted to occur later this year, scientists and policymakers are scrambling to prepare us for when the next big solar storm hits.
