

## indicated mineral resource

**indicated mineral resource** . That part of a *mineral resource* for which tonnage, densities, shape, physical characteristics, *grade*, and mineral content can be estimated with a reasonable level of confidence. It is indicated by information that is too widely or inappropriately spaced to confirm geological and/or grade continuity but is spaced closely enough for continuity to be assumed (JORC, 1999). Cf: *inferred mineral resource*; *measured mineral resource*.
