## New Report Identifies Possible Next Steps in U.S. Energy Development

New Report Identifies Possible Next Steps in U.S. Energy Development

3/30/2015

Alexandria, VA—The U.S. energy portfolio changes over time. Scientific and technologic advances related to hydraulic fracturing have dramatically increased the supply of U.S. oil and gas; because of this, a methane economy – in which natural gas provides the leading share of primary energy consumption – is now a possible scenario for U.S. energy development. In a report released by the American Geosciences Institute (AGI), the social, political, technical and environmental components of a methane economy are identified. The report also addresses how industry, government and the public might best work together to advance common energy goals.

The report is based on the inaugural AGI Critical Issues Forum where experts were asked to consider whether a natural gas-dominant economy is achievable in North America and if such an economy would be desirable. In this forum, U.S. geoscientists, economists and environmental experts identified barriers and enablers to such an economy. They reviewed geological, infrastructural, technological, and financial factors that may affect future gas supplies and the demand for natural gas. The experts also considered the environmental, health, and safety factors that may have a significant effect on the development of natural gas. One of the conclusions of the report is that social license granted by consensus public opinion – at the national, state and local levels – can be either a substantial enabler or barrier to a methane economy, and its importance cannot be overstated.

“In the U.S. we don’t really understand much about energy: where it comes from, the scale of demand or the benefits and challenges of producing different kinds of energy.” said Scott Tinker, Director of the Bureau of Economy Geology at the University of Texas at Austin, and State Geologist of Texas, “I don’t know where things will stand 50 years from now, but I do know that, like today, we are still going to be looking for sources that are affordable, accessible, reliable and sustainable. Those tenets will drive the energy mix, whatever it turns out to be.”

The inaugural Critical Issues Forum was hosted in Fort Worth, Texas in November 2014 the American Geosciences Institute’s Center for Geoscience and Society. The report is available for free download from the American Geosciences Institute website: <http://www.americangeosciences.org/policy/ci-forum-2014/final-report> or available for purchase from Amazon:

The American Geosciences Institute is a nonprofit federation of geoscientific and professional associations that represents more than 250,000 geologists, geophysicists and other earth scientists. Founded in 1948, AGI provides information services to geoscientists, serves as a voice of shared interests in the profession, plays a major role in strengthening geoscience education, and strives to increase public awareness of the vital role the geosciences play in society's use of resources, resiliency to natural hazards, and interaction with the environment.
