

Kalev Hantsoo

Kalev Hantsoo earned his bachelor's degree in Geology from the University of Maryland. His undergraduate thesis focused on the feedback effects between ocean chemistry and animal evolution in the early Cambrian Period. The project included field work with a team of paleontologists and geochemists at the official Ediacaran-Cambrian boundary, located on the coast of Newfoundland. At AGI, Kalev is researching the economic prospects of carbon capture technology and examining how western states are responding to the ongoing drought. After his internship, Kalev begins graduate work at Penn State, where he will study carbon cycling and climate change in the geologic past.
