On a visit to the National Mall in Washington, DC, one can see monuments of a nation—Memorials to Lincoln, Jefferson, and WWII, the Vietnam Veterans Memorial Wall, and Washington Monument. Standing among them is Voyage—a one to 10-billion scale model of our Solar System—spanning 2,000 feet from the National Air and Space Museum to the Smithsonian Castle. Voyage provides visitors a powerful understanding of what we know about Earth’s place in space and celebrates our ability to know it. It reveals the true nature of humanity’s existence—six billion souls occupying a tiny, fragile, beautiful world in a vast space.

Voyage is an exhibition that speaks to all humanity. Replicas of Voyage are therefore available for permanent installation in communities worldwide (http://voyagesolarsystem.org.)

This lesson is one of many grade K-12 lessons developed to bring the Voyage experience to classrooms across the nation through the Journey through the Universe program. Journey through the Universe takes entire communities to the space frontier (http://journeythroughtheuniverse.org.)

Voyage and Journey through the Universe are programs of the National Center for Earth and Space Science Education (http://ncesee.org). The exhibition on the National Mall was developed by Challenger Center for Space Science Education, the Smithsonian Institution, and NASA.
Lesson 2: Designing a Scale Model of the Solar System

Lesson at a Glance

Lesson Overview
Students conduct research on the planets, with emphasis on patterns and cycles, and gain an appreciation for the variation in length of year, length of day, and seasonal variation across the Solar System. To explore whether the patterns and cycles on the planets are related to planetary position in the Solar System, students create posters that can be used to mark the locations of the planets within a Voyage model of the Solar System.

Lesson Duration
One 45-minute class

Core Education Standards

National Science Education Standards
Standard D2: Objects in the sky
- The Sun, Moon, stars, clouds, birds, and airplanes all have properties, locations, and movements that can be observed and described.

AAAS Benchmarks for Science Literacy
Benchmark 4A4:
- The earth is one of several planets that orbit the sun, and the moon orbits around the earth.

Benchmark 9C6:
- Scale drawings show shapes and compare locations of things very different in size.

Benchmark 11B2:
- Geometric figures, number sequences, graphs, diagrams, sketches, number lines, maps, and oral and written descriptions can be used to represent objects, events, and processes in the real world.
Related Education Standards

AAAS Benchmarks for Science Literacy

Benchmark 9C3:
- Graphical display of quantities may make it possible to spot patterns that are not otherwise obvious, such as cycles and trends.

Benchmark 11D2:
- Finding out what the largest and the smallest values of something are is often as informative as knowing what the usual value is.

Essential Question

- What can we learn from designing a scale model of the Solar System?

Concepts

Students will learn the following concepts:
- Earth is one of several planets that orbit the Sun.
- The Earth is the third planet from the Sun.
- Each planet has a unique set of characteristics.

Objectives

Students will be able to do the following:
- Using the Voyage scale model and planetary data from other resources, make a poster of the Sun and planets, identifying their scale distances from the Sun.
- Identify unique characteristics of Earth, especially regarding its location in relation to the Sun.
Science Overview

The Planets
Eight major planets orbit the Sun. They fall into two main categories:

- The inner planets, which are also called “terrestrial” (“like Earth”) or rocky planets, are small and have a dense, solid core and surface, which we could stand on. These planets are Mercury, Venus, Earth, and Mars.

- The outer planets, which are also called the “Jovian” (“like Jupiter”) planets or gas giants, are large and have extensive atmospheres. Trying to stand on their visible surfaces would be like trying to stand on a cloud. This applies to Jupiter, Saturn, Uranus, and Neptune.

Pluto is a special case. It used to be called the ninth planet, but after the discovery of several objects similar to Pluto further out in the Solar System—the largest of which is larger than Pluto—the International Astronomical Union decided in 2006 that Pluto belongs to a new class of objects called dwarf planets, and is not an actual planet. Pluto is included in the discussion of planets here as an example of this new class of objects. It is small, like the terrestrial planets, but unlike them, is made of a mixture of ice and rock.

The Voyage Model
Voyage is a 1 to 10-billion scale model of the Solar System that was permanently installed in Washington, DC, in October 2001. The real Solar System is exactly 10 billion times larger than the Voyage model. On this scale the Sun is about the size of a large grapefruit. The Earth is 15 meters (50 feet) away and smaller than the head of a pin. The entire orbit of the Moon fits comfortably in the palm of your hand. Pluto is approximately 600 meters (2,000 feet or 6.5 football fields) away from the Sun. The nearest star to the Sun would be the size of a cherry located in coastal California.

We are going to use the Voyage model in this lesson. The Student Worksheets also have graphical representations of the Sun and planets at the scale of Voyage.

Table 1 includes some basic characteristics of the eight planets in the Solar System, as well as Pluto (as an example of dwarf planets.) The table includes rotation and revolution periods, which give rise to the length of a day and a year on that planet.

Life on Earth
Earth is located in a unique place in the Solar System. It receives just enough energy in the form of light and heat from the Sun to support many forms of life.
Even though the temperatures feel different in winter and summer, there is relatively little variation in the Earth’s temperatures. This allows life to thrive on Earth. Living things could not survive the temperature extremes of hot and cold on the other planets. On Venus, lead would melt. On Pluto, the air in your lungs would freeze solid. If the Earth were much closer to the Sun, it would be too hot for living beings to survive when the Earth faced the Sun. If Earth were much farther away, the Sun would not be able to warm the planet enough for life to survive.

Earth also has water, which, in addition to energy, is a requirement for life. For now, there is no direct proof that liquid water currently exists on any other planet.

The Earth also has an atmosphere that provides natural protection from some of the Sun’s harmful radiation. Some of this is in the form of ultraviolet light. The Earth remains the only known place in the Solar System, and in fact the Universe, that has—or ever has had—life.

Conducting the Lesson

Warm-Up & Pre-Assessment

Preparation & Procedures
Let the class know they are going to design a model of the Solar System. Discuss what that means and why they are doing it. When they design the model Solar System, they will learn a lot about the characteristics of each planet, and what it would be like if they lived there.
Notes:
Activity: Build a Scale Model of the Planets

Students create a poster for each planet that contains planetary characteristics relevant to patterns and cycles, together with a graphic representing the planet at the Voyage scale, and the number of paces to the next planet. At the end of this activity students are ready to lay out the Voyage scale model Solar System.

Student Materials

- 1 posterboard per student, 24” x 36”
- 1 set of Voyage worksheets per student
- Glue
- Scissors
- Colored crayons or markers

Preparation & Procedures

1. Ask the students how they can make their own model of the Earth, Sun, Moon, and neighboring planets. They will need to 1) use their research information from previous lessons; 2) consult class wall charts with planetary facts; or 3) find out interesting facts about the planets as homework. (These facts will be added to the posters.)

2. Have the students look for information reflecting cycles associated with the planets, including length of day, length of year, and daily and annual variations in temperature.

3. Hand out the posterboard and Student Worksheets with the scale models and pacing charts.

4. Have students cut out the planets and Sun and position them on the posterboard. Students must place the planets in order from the Sun. Make sure students leave enough space between the model planets to write information about how far to walk to place each planet.

5. Have students glue the planets and Sun onto the posterboard.

Teaching Tip

There is information about the Voyage model on the Student Worksheet. This is for students to incorporate onto their posters. They should not just copy the information on to their poster, but use the information to write directions for where to place each planet relative to the model Sun. The directions should allow a student to “pace” out the Solar System. The charts assume one “pace” is one meter long. For younger students, a pace would likely be two steps.
6. Tell the students to write out the pace instructions for constructing the scale model. (Suggested wording: “To reach the next planet (e.g., Venus), walk 4 paces.”

7. Tell the students to add information from their research.

**Reflection & Discussion**

1. Now that the students can see the relative size of all the planets on a 1:10-billion scale model, ask them to consider the following questions.
   - Which planet is closest to the Sun? Which is farthest from the Sun?
   - Can you name the planets (including the dwarf planet Pluto) in order from the Sun? (Help the students remember the sequence of the planets using the mnemonic “My very excited mother just served us nine pizzas.” The first letter of each word is the first letter of the planets’ names in order from the Sun.
   - What is the largest planet? The smallest?
   - Which planets are called the inner planets? The outer planets?

2. Discuss the following questions:
   - What was the most surprising thing you learned about the planets?
   - What was the most interesting?
   - What would you like to learn more about?

**Transfer of Knowledge**

1. Discuss with students how big the Earth is, how many hours or days it takes to drive across the country, or how long it takes to fly places even in airplanes. Emphasize that most of the time, people never even go to the other side of the Earth from where they live.

2. Have students compare their understanding of the Earth’s size to the 1:10-billion scale model on their posterboards. See if they can imagine how tiny a country, a building, or a person would be on this scale.

3. Have the students compare Earth to the largest planet, Jupiter. Ask the students what they think is between Earth and Jupiter in space. Have them hypothesize as to how “full” or “empty” space is.

4. Discuss their remarks and questions about what must exist in between the planets, in all that space (mostly nothing).
ASSessment Criteria for Activity 1

Grades 3-4 students may be evaluated as follows. They need not demonstrate all the characteristics of a category to fall within it, though strong evidence of their classification by the teacher should be provided.

4 Points
❖ Clearly and consistently demonstrates a sophisticated understanding of the concepts nearly 100% of the time by applying them accurately in activities, questions, comments, work, and projects both in the classroom and elsewhere.

3 Points
❖ Shows a nearly complete grasp of the concepts by using them appropriately at least 75% of the time in class, asking pertinent questions, and by making viable attempts at applying the concepts to other aspects of learning.

2 Points
❖ Responds correctly to direct questions regarding the meaning of the concepts, but cannot yet express them or demonstrate them consistently and accurately; still makes errors about 50% of the time.

1 Point
❖ Indicates little more than random guessing at understanding the concepts; cannot focus on essential elements or regularly respond correctly to leading questions; less than 50% accurate.

0 Points
❖ No work completed.

Placing the Activity Within the Lesson
Discuss with students how, by building a scale model Solar System, they can gain an appreciation of Earth as a unique planet, one of nine in the Solar System.
Lesson Wrap-Up

Lesson Closure
Have a class discussion about how they would take the model Solar System they just designed and set it up in a playground.

Have a class discussion about why Earth’s characteristics are important for life:

- Not too close or too far from the Sun. Temperature is right for liquid water and, therefore, life.
- It has an atmosphere which protects life from harmful types of sunlight, like ultraviolet light.
