# Canada is a mining nation

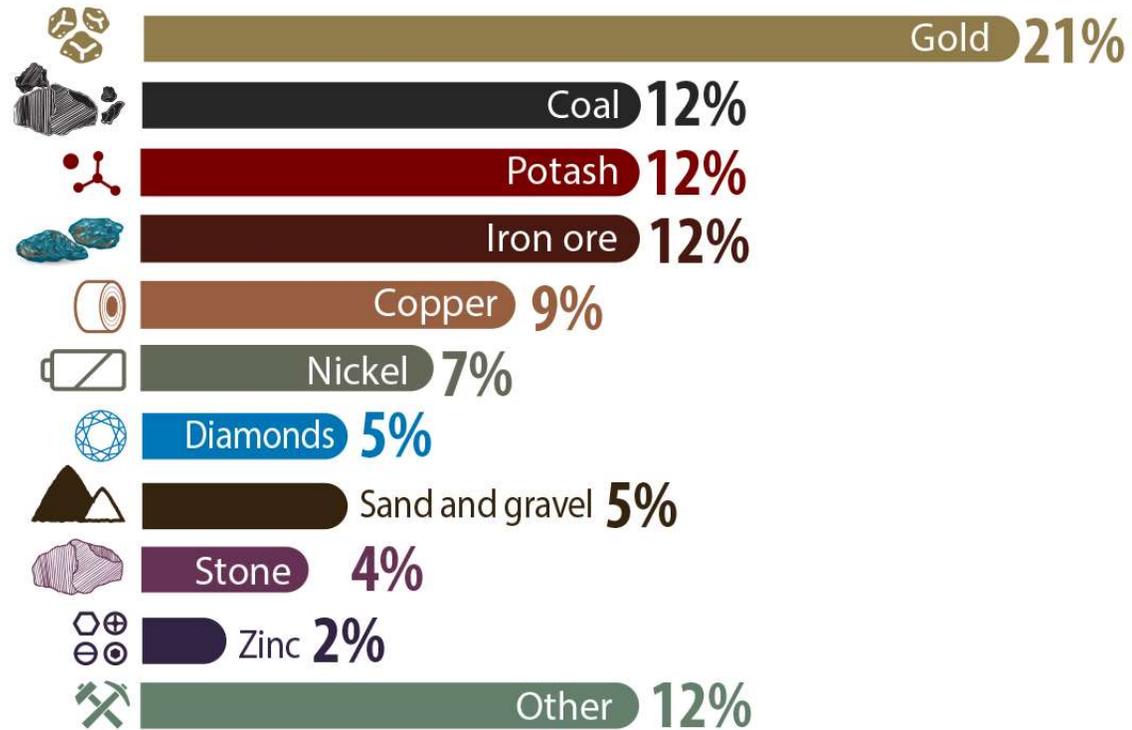

- Exploration and mining are important to the Canadian economy;
- Also host to large supply, service, and financial industry.

Accounting globally in 2019 for

- 48% of public mining and exploration companies
- 48% of the number of financings
- 56% of the mining equity capital raised

## Leading minerals, by value of production, 2019

# Canada

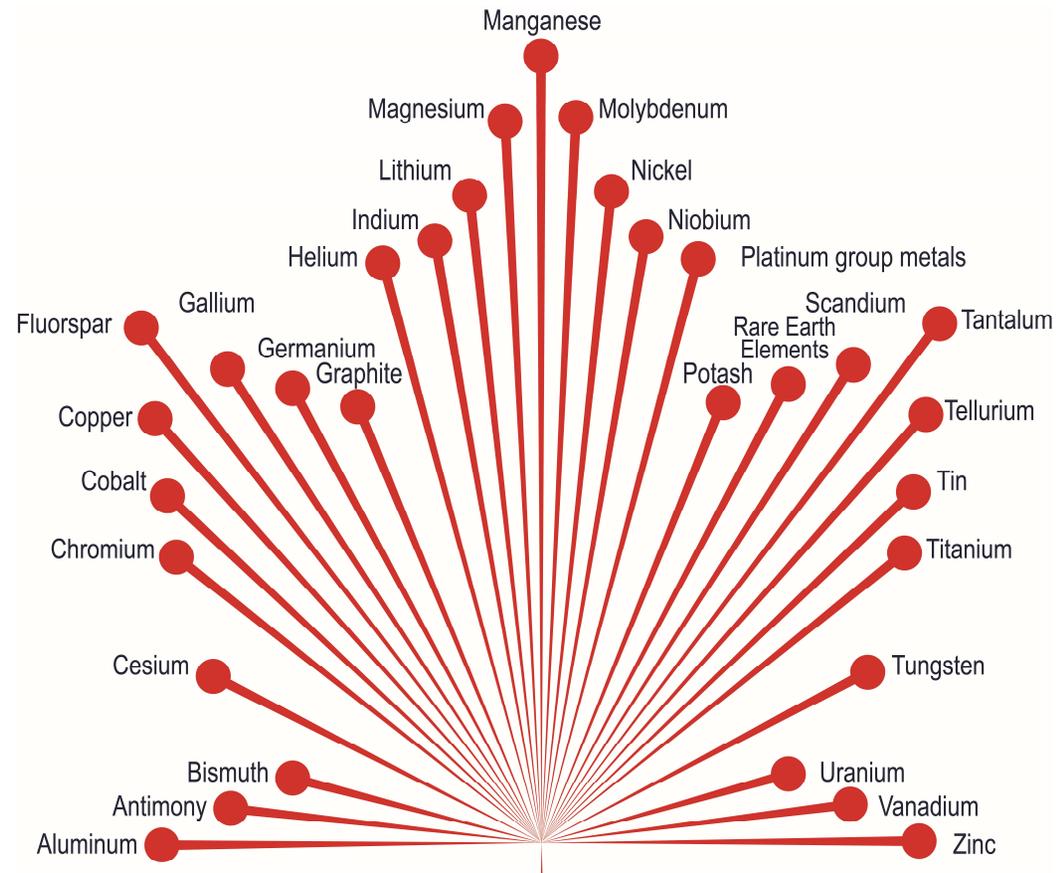

# Critical mineral list

## Definition:

1. Required for economic security;
2. Required for low-carbon economy;
3. A sustainable source of critical minerals for our partners.

## Motivations:

1. Supply chain development;
2. Policy development
3. International engagement;
4. Support research and development;

# Canada's critical mineral production

- Canada is already a producer of some critical raw materials:
  1. Potash is important for fertilizer and is sourced from ancient evaporite deposits (e.g., K3, SK);
  2. Niobium is used in the aerospace industry and is sourced from carbonatite deposits (e.g., Niobec, QC);
  3. Nickel, cobalt, and PGE are used in batteries and other car components and are sourced from magmatic sulphide deposits (e.g., Sudbury, ON);
  4. Indium is used in touchscreens, sourced from sediment-hosted deposits (Red Dog, AK), and produced from Zn smelting-refining (e.g., Trail, BC);
  5. Caesium is used in defense and is sourced from pegmatite deposits (e.g., Tanco, MB)
- However, production estimates for most other critical raw materials are relatively minor globally.

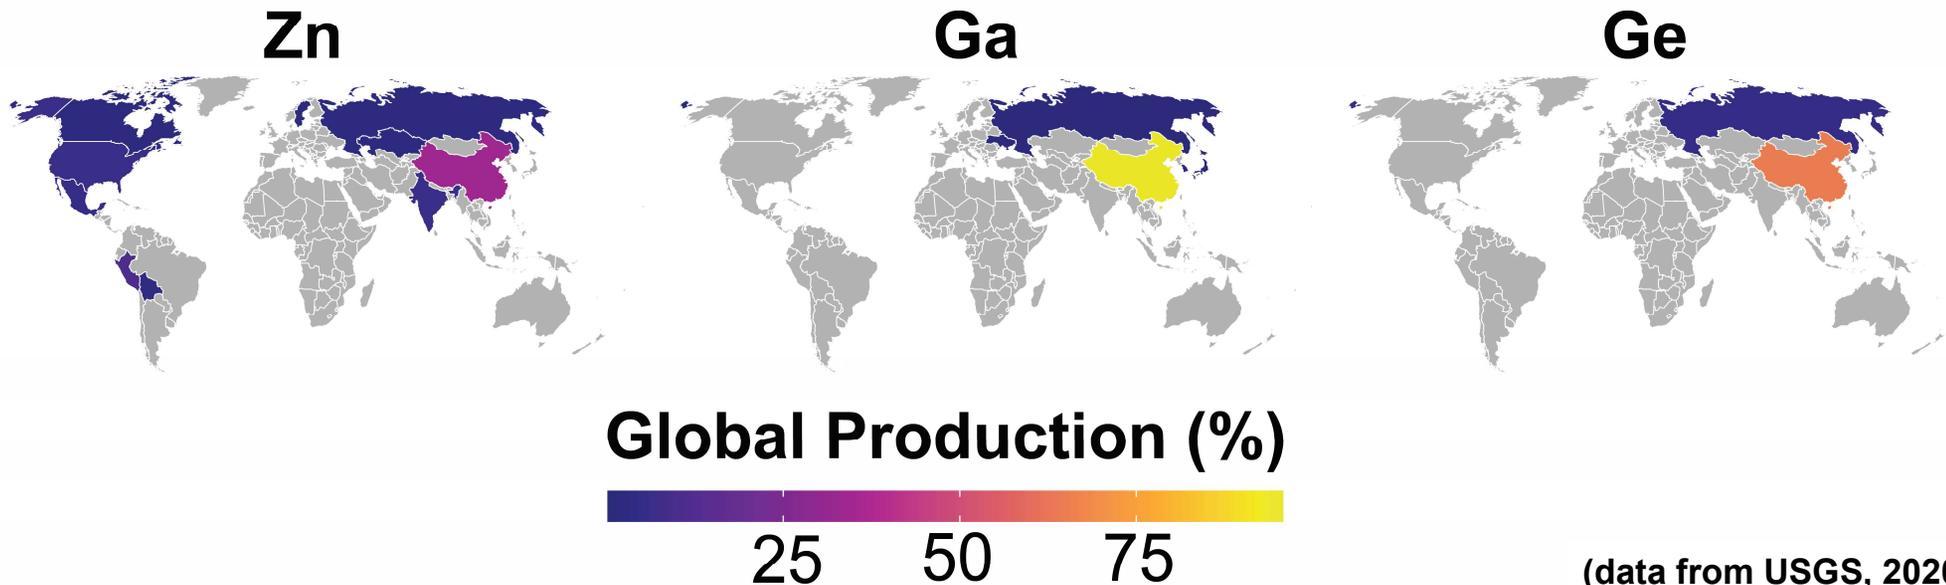

(data from USGS, 2020)

# Critical minerals as bi-products

- Canada is a major producer of base metals (e.g., Cu, Zn, Pb);
- Bi-products from these deposits (e.g., VMS, CD, MVT) include critical minerals;
- Critical mineral associated with Zn mining is currently dominated by China;
- Basin-hosted mineral systems are the focus of CMMI and international cooperation.

# Diversifying Canada's production

- Geological surveys can contribute by:
  - Improving availability of pre-competitive data in prospective critical mineral districts;
  - Improved conceptual models for unconventional mineral systems (e.g., brines, seafloor, mine waste, deposits undercover)

# Targeted Geoscience Initiative

- Targeted Geoscience Initiative (TGI) program;
- Main mineral research program at the Geological Survey of Canada (GSC);
- Phase six renewed in 2020;
- Renewed focus on critical minerals;
- Results are free at **GEOSCAN**

## Time for Action!

Canada could miss the next wave of investment for clean mineral to support building an integrated critical minerals value chain unless it:

- Maintains and improves ESG record and other best practices to secure at home projects and investments
- Maintains world renown and leading mining sector expertise
- Reduces project development lead times
- Decreases exploration risks and improve discovery of quality resource (grade and economics) and processing efficiency
- **Engages in a strong international collaboration as set by the Critical Minerals Mapping Initiative**

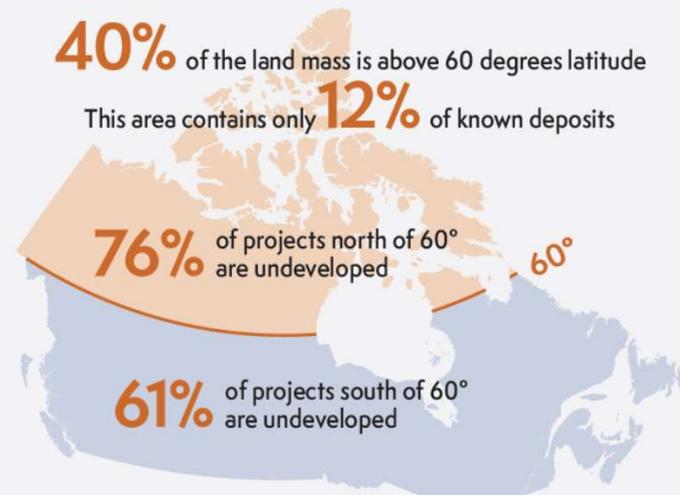

Much of Canada's natural resource potential lies in northern, remote and isolated regions —but it is not being fully realized

40% of the land mass is above 60 degrees latitude

This area contains only 12% of known deposits

76% of projects north of 60° are undeveloped

61% of projects south of 60° are undeveloped

(PDAC, 2016)
