Comprehensive risk matrix

Risks from liquid wastes: produced water, ponds and tanks, surface water, seismic

Ecological

Health (truck accidents, low birth weight)

Quality of life (property values)

Valuation

Research priorities

Activity→burden→toxicity→probability in environment→ probability of exposure→impact→ value

Risk Matrix

Site Development and Drilling Preparation

After locating a site for shale gas development, the area must be excavated and prepared for drilling. Preparation activity also often includes leveling of the site.

Activity	Intermediate Impacts					
	Groundwater	Surface Water	Soil Quality	Air Quality	Habitat Disruption	Community Disruption
Clearing of land/construction of roads, well pads, pipelines,		Stormwater flows	Stormwater flows	Conventional air pollutants and CO ₂	Habitat fragmentation	Industrial landscape
other infrastructure		Invasive species			Invasive species	Light pollution
						Noise pollution
On-road vehicle activity		Stormwater flows		Conventional air	Other	Noise pollution
				pollutants and CO ₂		Road congestion/accidents
Off-road vehicle activity		Stormwater flows		Conventional air pollutants and CO ₂	Other	Noise pollution

Return to Top

Drilling Activities

Drilling begins by boring a single well shaft vertically into the desired formation. One or more lateral wells are then drilled from the end of the vertical wellbore, angling to run horizontally through the shale formation.

Activity	Intermediate Impacts					
	Groundwater	Surface Water	Soil Quality	Air Quality	Habitat Disruption	Community Disruption
Drilling equipment operation at surface	Drilling fluids/cuttings	Drilling fluids/cuttings	Drilling fluids/cuttings	Conventional air pollutants and CO ₂		Industrial landscape Light pollution Noise pollution
Drilling of vertical and lateral wellbore	Methane Drilling fluids/cuttings Intrusion of saline- formation water into fresh groundwater	Drilling fluids/cuttings		Methane		

Wastewater characteristics from Marcellus shale gas development in PA

- Researchers: J. Shih, S. Olmstead (UT Austin), J. Chu, L. Muehlenbachs (U. Calgary), J. Saiers (Yale), S. Anisfeld (Yale).
- Statistically analyzes characteristics of flowback, produced water, and drilling fluid waste sent to wastewater treatment facilities in PA, 2008-2011.
- Data Source: Form 26R, submitted to PADEP by "residual waste" generators.
- 432 different analytes were identified in the data, in the following categories:
 - 1. General chemicals
 - 2. Organics
 - 3. Pesticides
 - 4. Metals
 - 5. Radioactive Materials

Comparison of <u>General Chemicals</u> in Produced Water and Fracking Fluid Waste

* Number at the bottom of the boxplot is the sample size

Comparison of <u>Metals</u> in Produced Water and Fracking Fluid Waste

Comparison of <u>Organics</u> in Produced Water and Fracking Fluid Waste

Comparison of Naturally Occurring Radioactive Materials in Produced Water and Fracking Fluid Naste

Analysis of state databases of spills and releases

- New Mexico, Colorado, and Oklahoma (not comparable)
- Only reported spills/releases
- Materials spilled: Produced water, fracturing fluid, brine, drilling mud/fluid, HCI, KCI, crude oil, fresh water

Figure: Spills from pits and frac tanks as reported to New Mexico OCD.

Analysis of state databases of spills and releases

Number of spills in New Mexico by category (2000 – 2013)

Panel A: Pits

Cause of spill	# spills
Overflow	33
Liner malfunction	31
Unidentified or undocumented	19
Discovery of historical spill	8
Blowover	7
Improper closure or reclamation	3
Sinkhole	2
Other	2
TOTAL	105

Panel B: Frac Tanks

Cause of spill	# spills
Leak	21
Unidentified or undocumented	13
Overflow	9
Other	3
Collapse	2
Vandalism	2
TOTAL	50

Surface Water Quality Risk Study (PNAS, 2013)

We exploit spatial and temporal variation in the proximity of shale gas wells, waste treatment facilities, and surface water quality monitors in Pennsylvania to estimate:

- 1. the impact of *shale gas wells* on downstream chloride and TSS concentrations; and
- 2. the impact of *shale gas waste treatment* and release to surface water on downstream chloride and TSS concentrations.

Conclusions

- No statistically significant impact of shale gas wells on downstream chloride concentrations.
 - A positive result here would have been consistent with contamination problems from spills, dumping, etc.
- Release of treated shale gas waste to surface water by permitted waste facilities appears to increase downstream chloride concentrations.
 - Effect is significant only for POTWs, not CWTs.
- Shale gas wells appear to increase downstream TSS concentrations.

Induced Seismicity

- Seismicity from fracking NOT a problem
- Deep well injection
 - #3 in anthropogenic earthquakes):
 - 40,000 wells taking oil and gas liquid wastes.
 - Growth in earthquakes > 3.0 since 2009, "coincident with" oil and gas waste injections."
 - In CO, TX, OH, ARK, OK. a few "caused by."

Cumulative number of earthquakes with a magnitude of 3.0 or larger in the central and eastern United States, 1970–2013. The dashed line corresponds to the long-term rate of 20.2 earthquakes per year, with an increase in the rate of earthquakes starting around 2009.

Induced Seismicity, cont.

- DWI better than pits, which leak; better than CWTs which can't treat some elements of produced water
- Can it be managed?
 - Industry cutting water flows through reuse/recycling, using less liquids

Sawyer, Hall, and Ryan Nielson. 2010. <u>Mule Deer Monitoring in the</u> <u>Pinedale Anticline Project Area: 2010 Report</u>. Cheyenne, WY: Western Ecosystems Technology.

Sawyer, Hall, and Ryan Nielson. 2010. <u>Mule Deer Monitoring in the</u> <u>Pinedale Anticline Project Area: 2010 Report</u>. Cheyenne, WY: Western Ecosystems Technology.

Figure 6. Predicted level of mule deer habitat use during Year 10 (winter of 2009-10) of natura gas development on the Mesa.

Truck Traffic Accidents in Pennsylvania by Well Activity

Property Values

- Great aggregator of local perceived risks with real effects
- Effects of proximity and intensity
- Proximity Matters
 - Within 1.5 km and on groundwater: \$33,000 decrease versus homes further away and on public water
- Intensity Matters a little

■PA ■TX

Figure 2. Estimated WTP (\$ household⁻¹ year⁻¹), on average, for the reduction of risks associated with shale gas development

Research priorities for the future

- Remainder of the water cycle
- Net benefits to communities of SGD
- Approaches for internalizing externalities and compensating locals.
 - Act 13. Turned down by PA Supreme Court.
- Mental health effects of SGD? Low Birth Weight effect?
- Legacy

Thank you!
