

# Contribution to volcano disaster prevention based on geological mapping; Case study on Fuji Volcano

Hoei crater  
=1707 eruption

ISHIZUKA Yoshihiro  
Geological Survey of Japan, AIST

View from the south

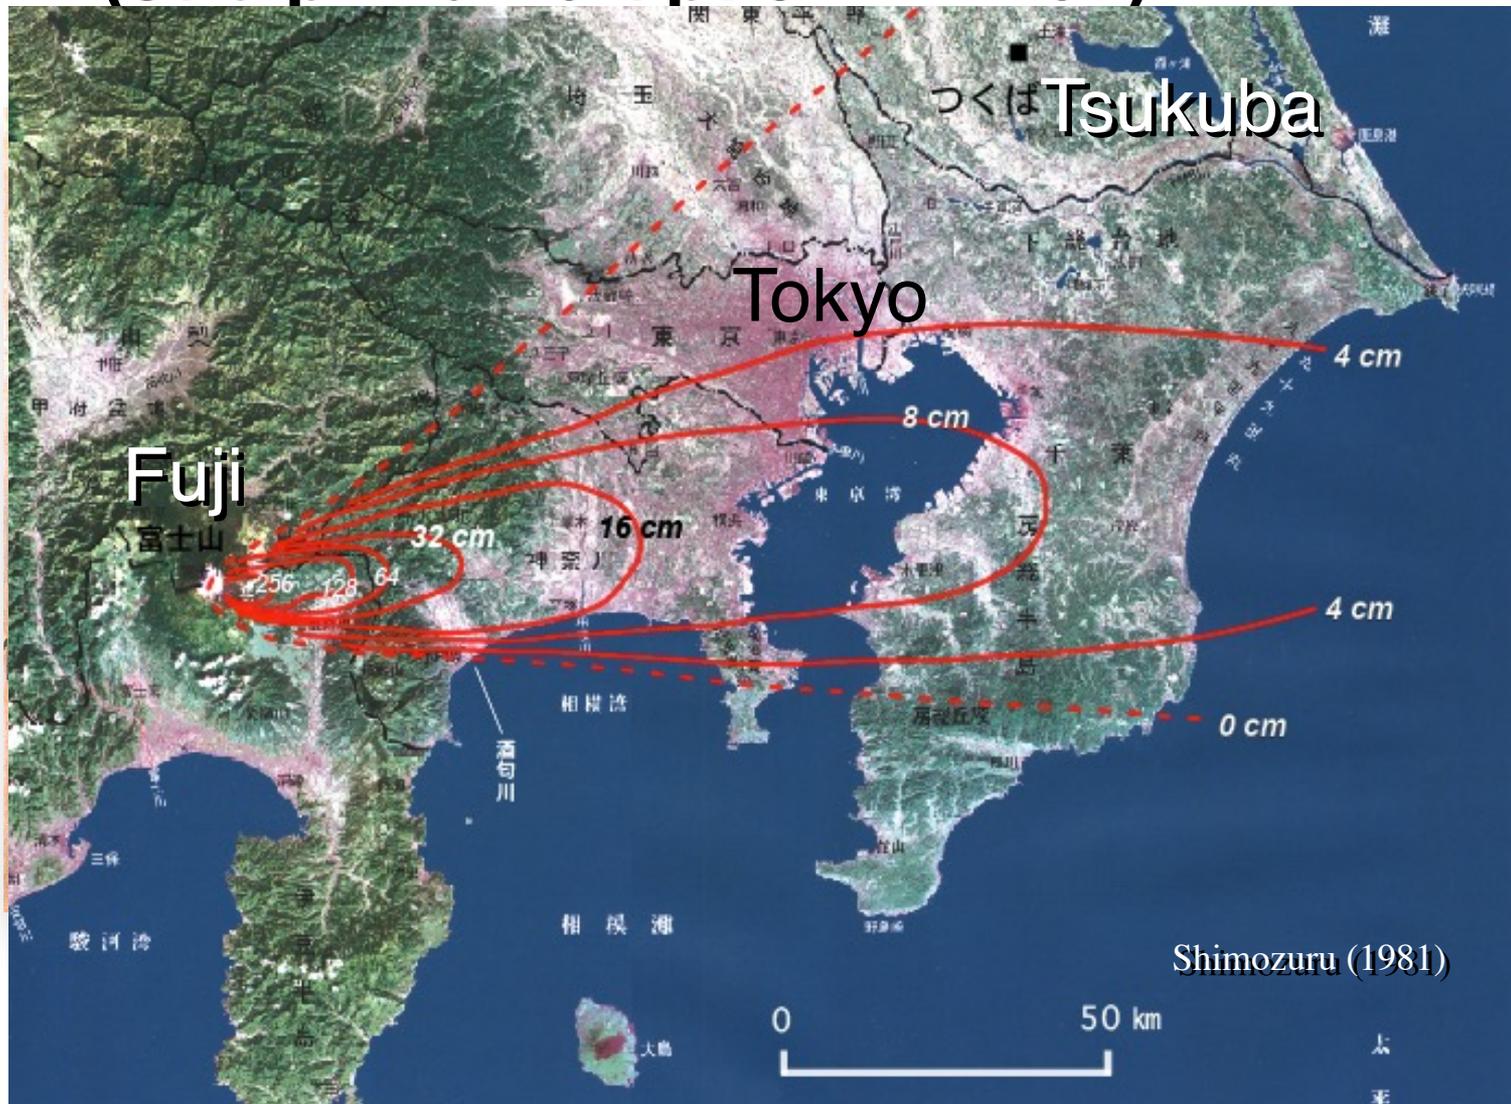

S. Nakano  
*Volcanoes of Japan*  
GSJ, AIST

**summit in the summer**

GSJ, AIST

**Highest in altitude**  
**Biggest in volume**  
**→ 300,000 climbers/year (July to September)**

# Last eruption occurred at SE flank (sub-plinian eruption in 1707)

## Scientific Research

### National Institute

Geological Survey of Japan (GSJ)

National Research Institute for Earth Science and Disaster Prevention (NIED)

Meteorological Research Institute  
And others

### Universities

Earthquake Research Institute (ERI) of Univ. Tokyo

Disaster Prevention Research Institute (DPRI) of Kyoto Univ.

Other universities

ADVICE

**Disaster prevention authority**

**Monitoring and Alert authority :**

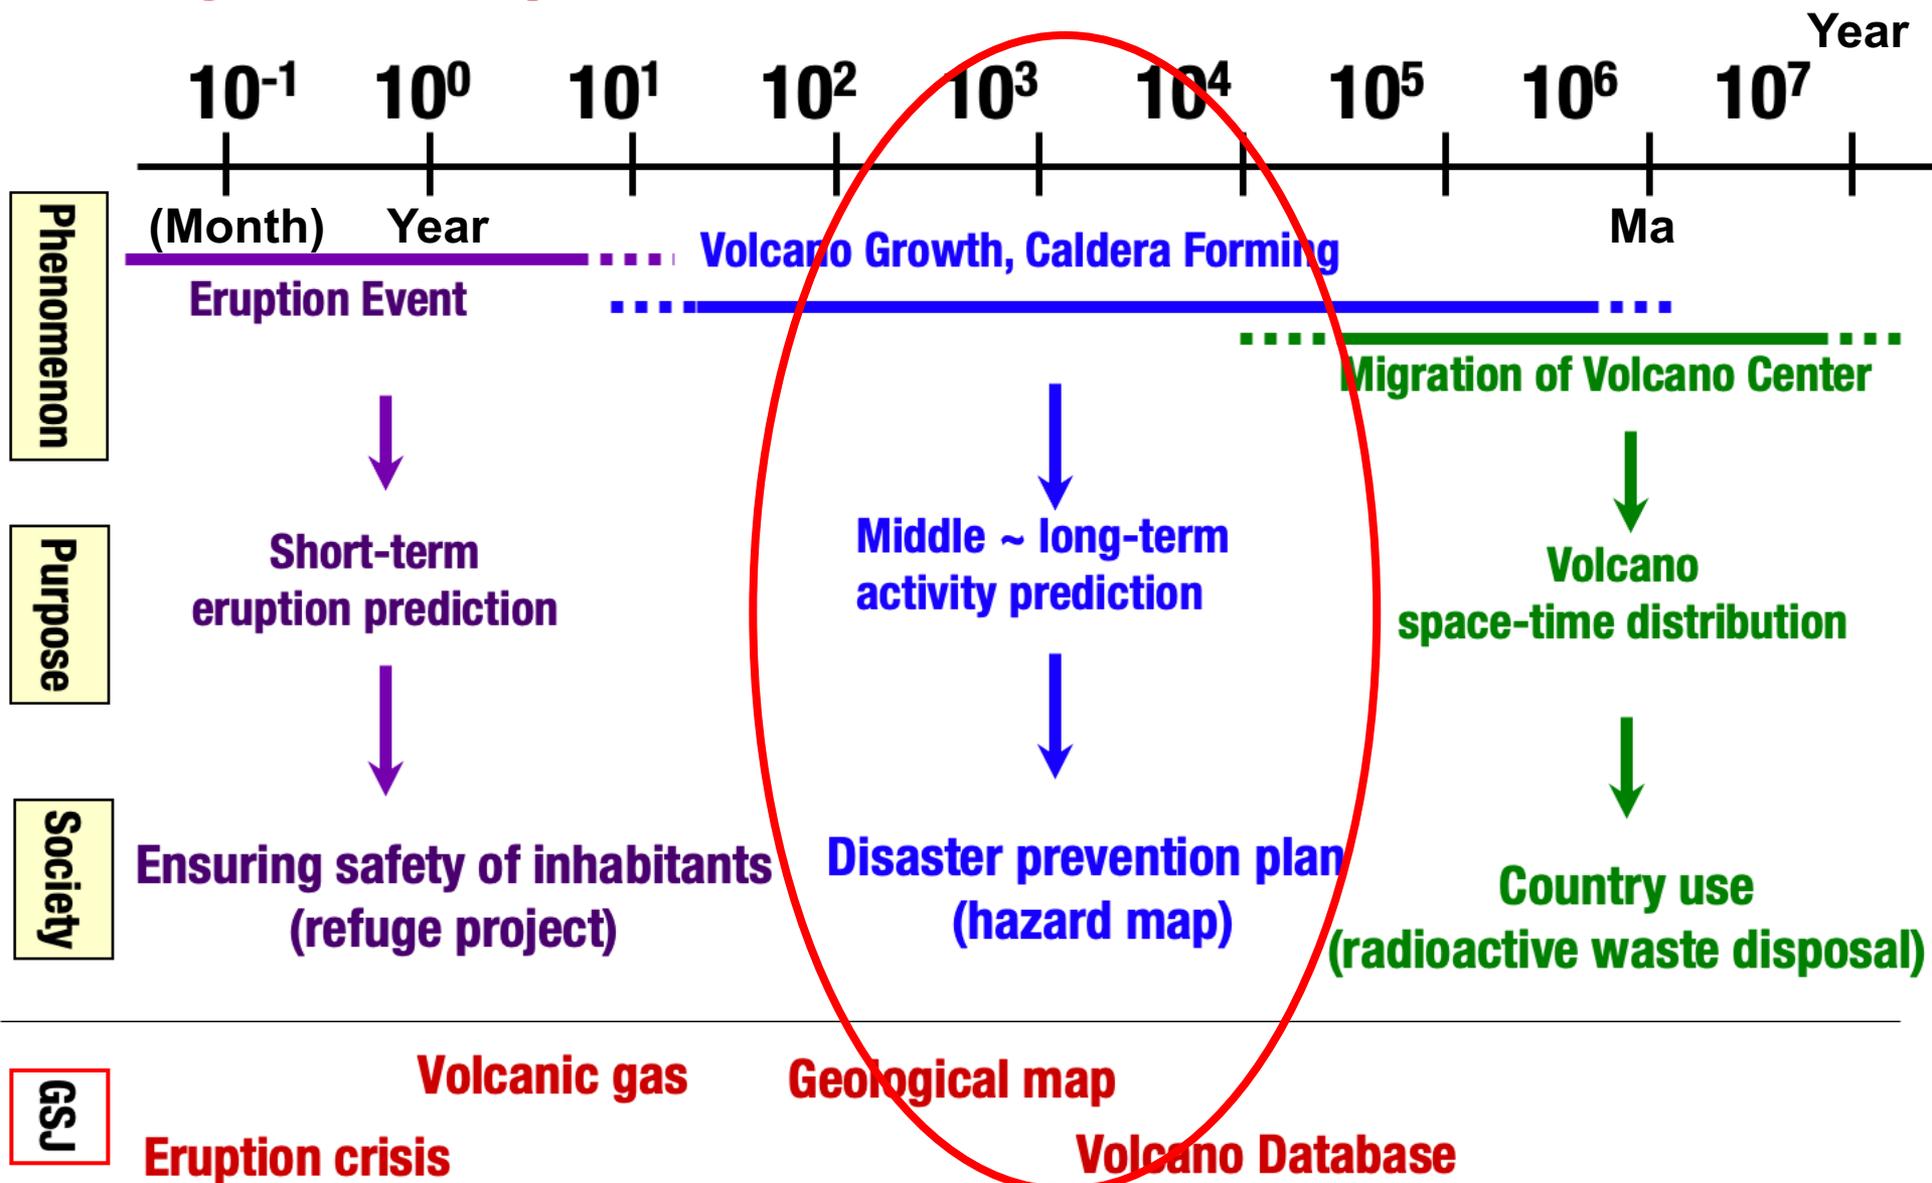

Japan Meteorological Agency (JMA)

**Evacuation and risk management:**

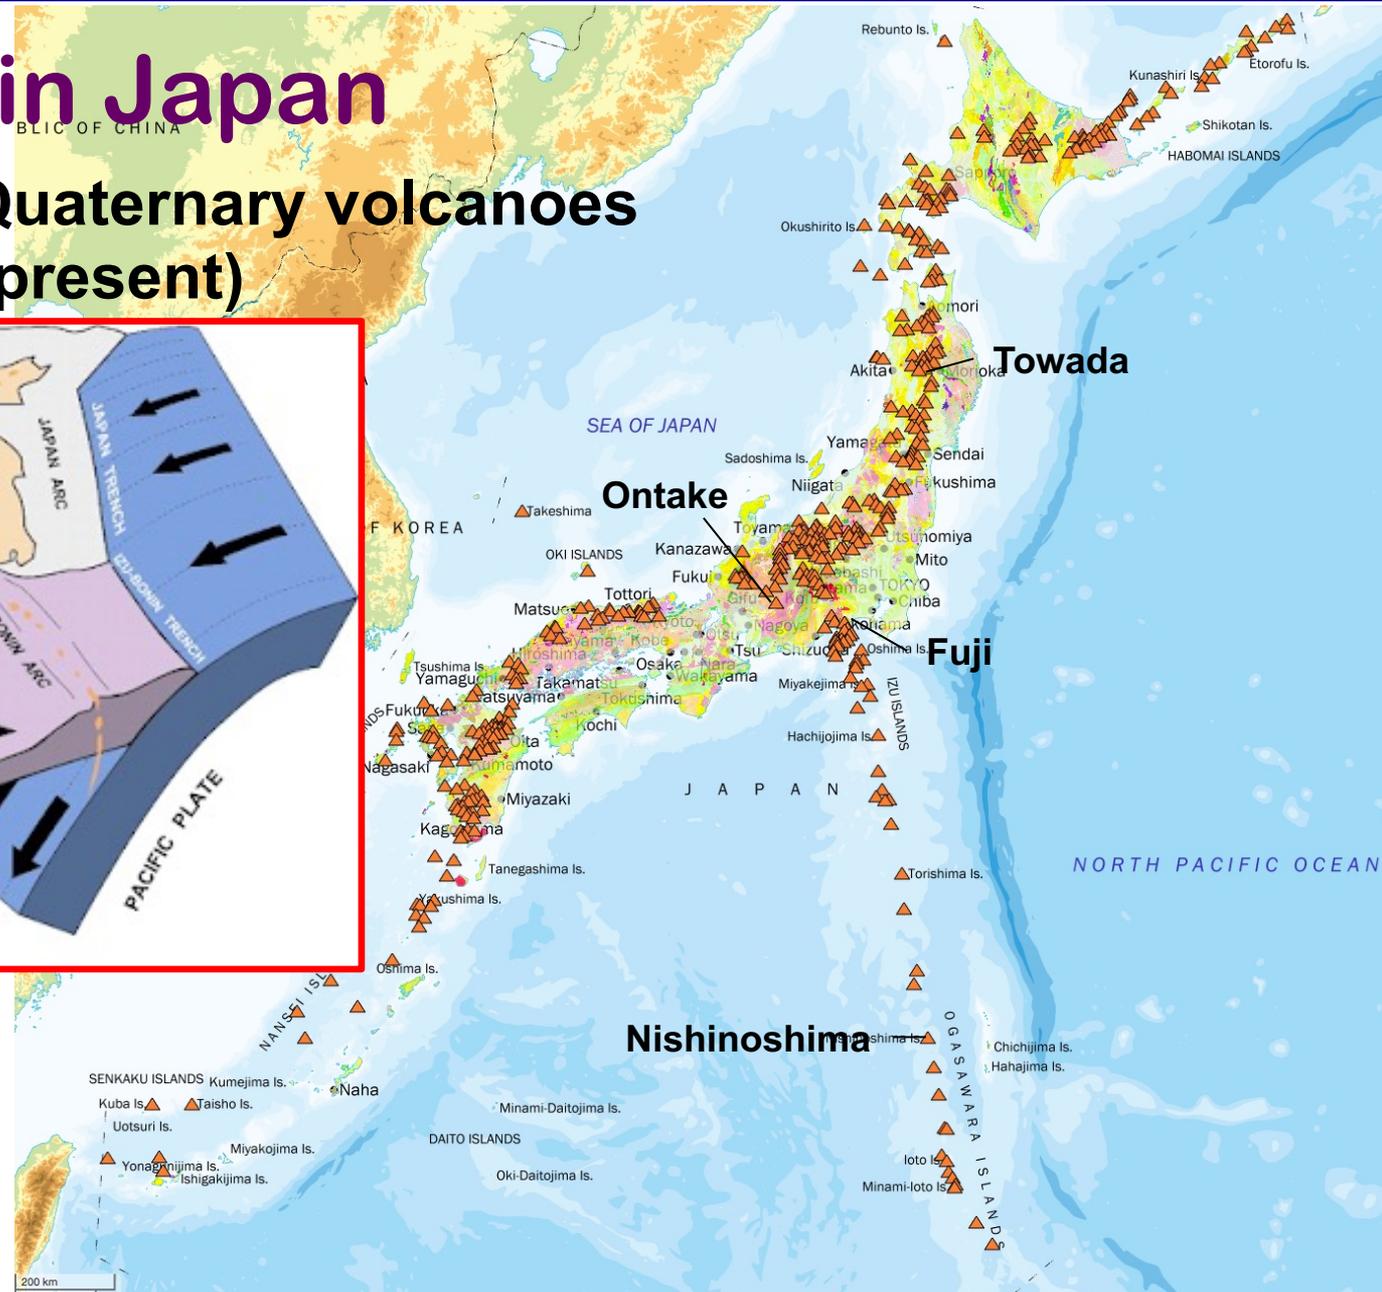

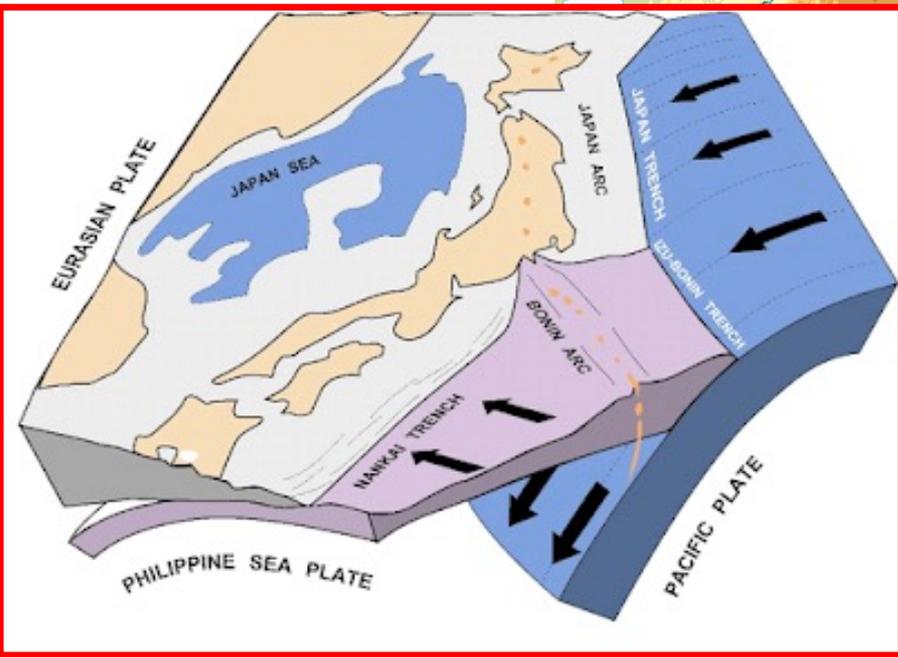

Local Government

## Study volcanic phenomena on various time scales

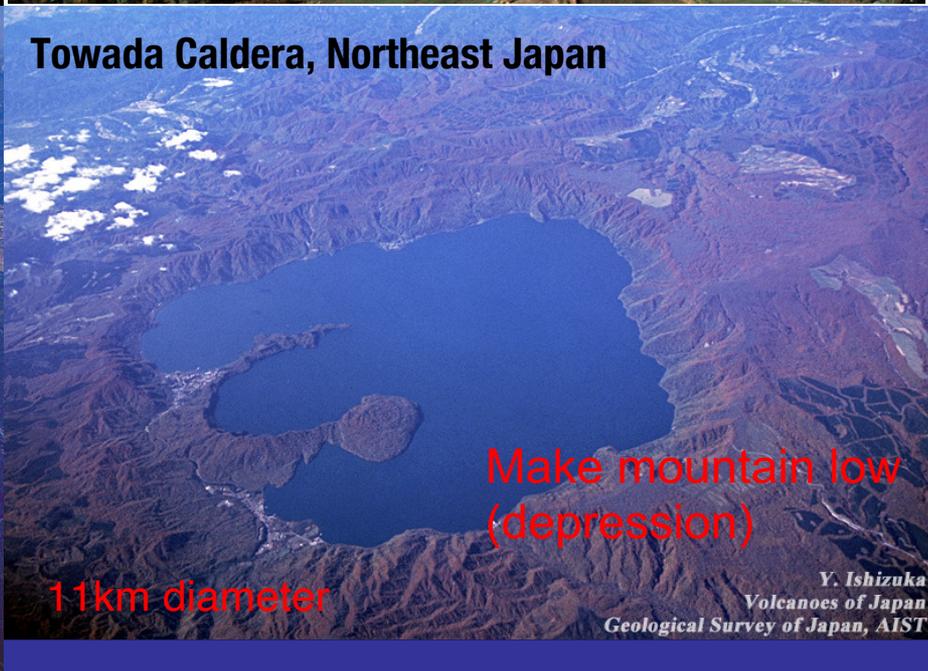

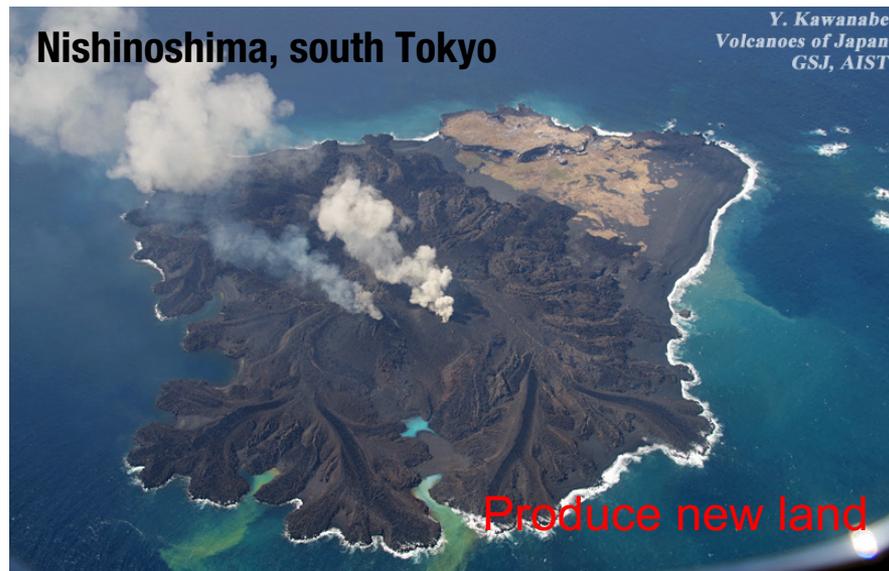

## Volcanoes in Japan

- More than 460 Quaternary volcanoes (from 2.6 Ma to present)

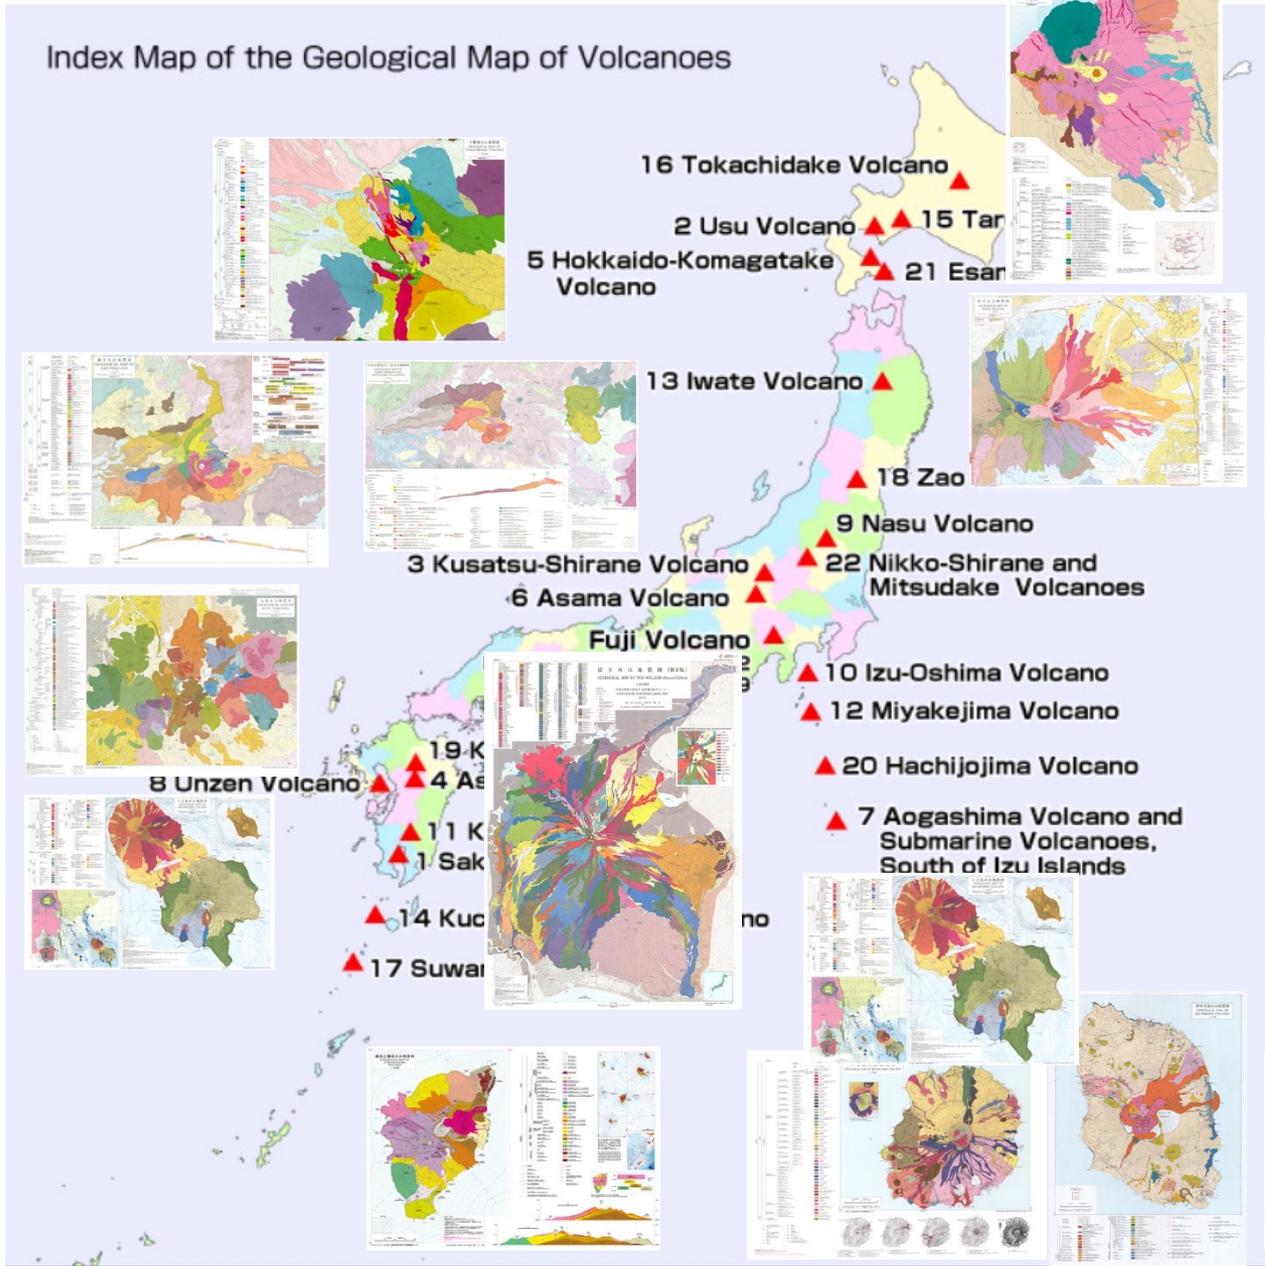

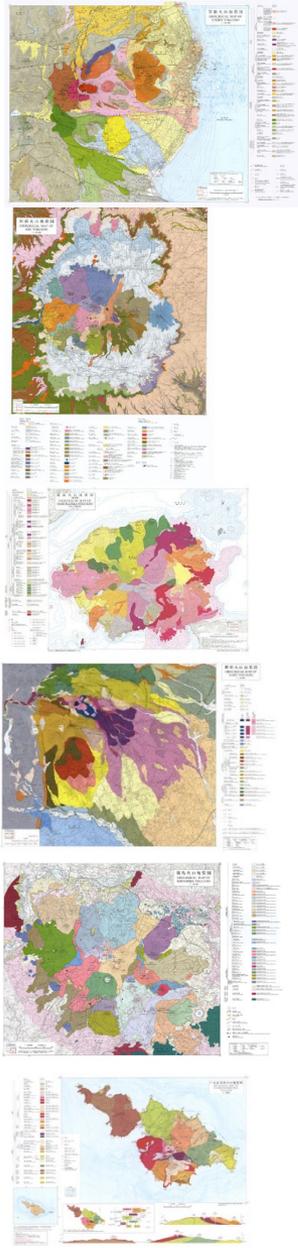

## From basaltic small volcanoes to large silicic calderas

## Index Map of the Geological Map of Volcanoes

16 Tokachidake Volcano  
 2 Usu Volcano  
 5 Hokkaido-Komagatake Volcano

13 Iwate Volcano  
 18 Zao

3 Kusatsu-Shirane Volcano  
 6 Asama Volcano  
 Fuji Volcano  
 9 Nasu Volcano  
 22 Nikko-Shirane and Mitsudake Volcanoes

10 Izu-Oshima Volcano  
 12 Miyakejima Volcano  
 20 Hachiojima Volcano

19 K  
 4 A  
 11 K  
 1 Sak  
 14 Kuc  
 17 Suwa

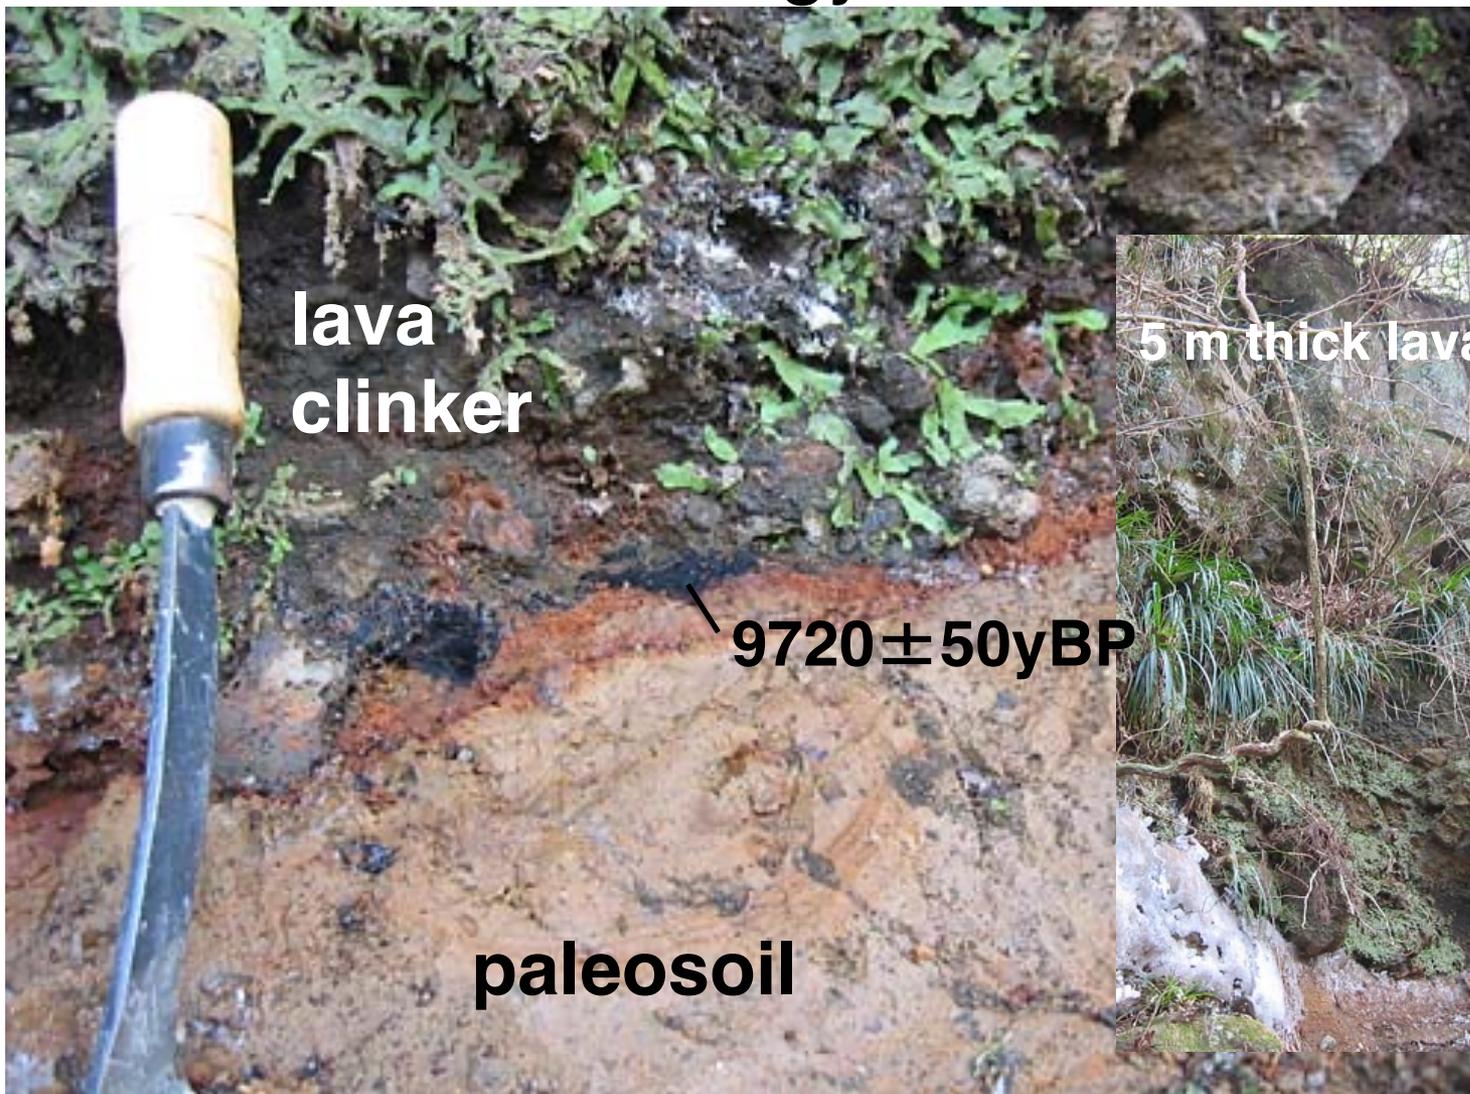

7 Aogashima Volcano and Submarine Volcanoes, South of Izu Islands

# Using a small excavator

# Chronology in the foot area

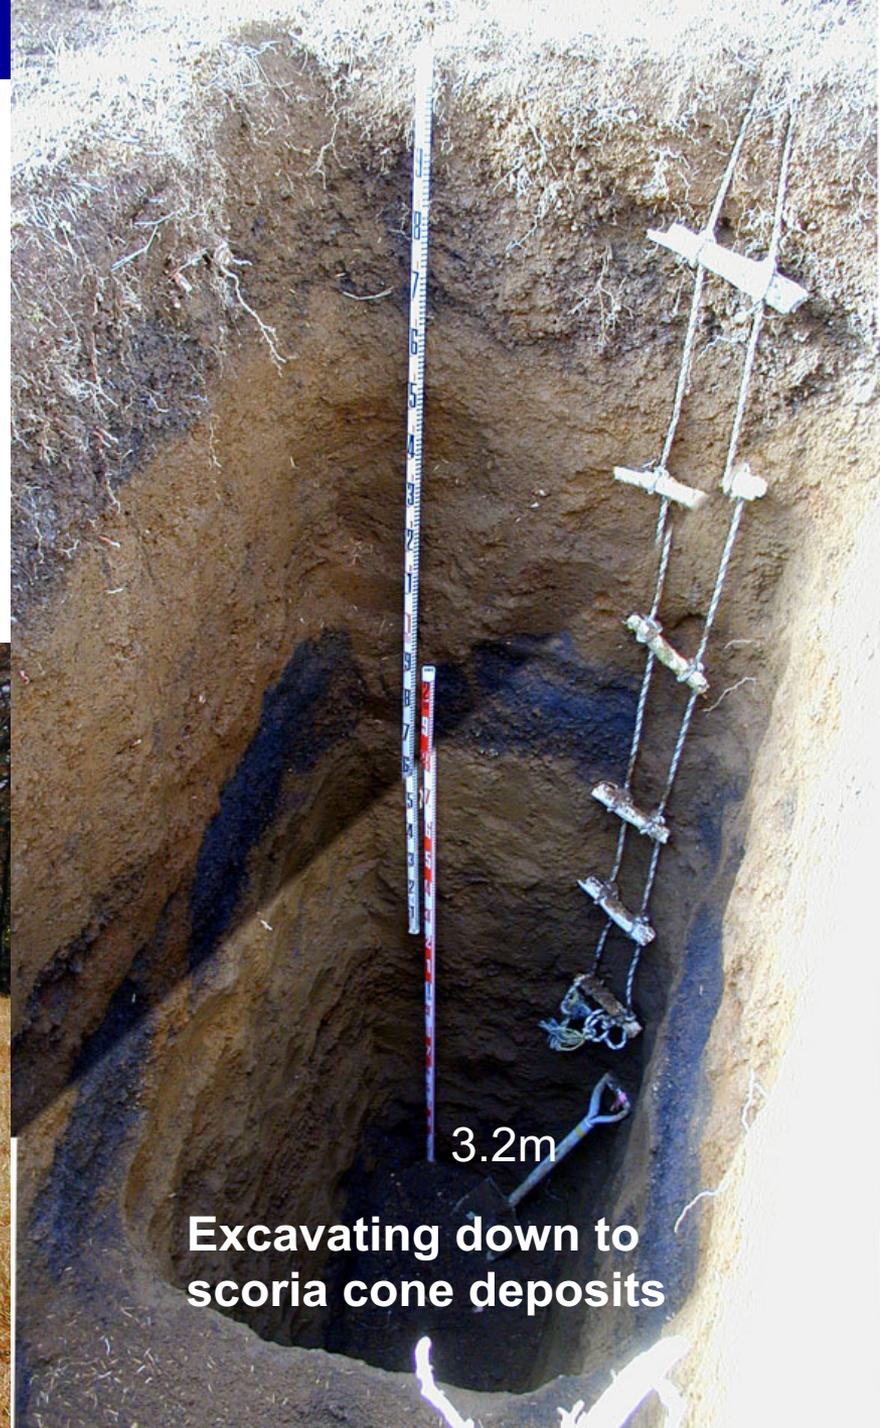

At 146 sites, charcoals/paleosol were determined the age of eruption for Fuji.

# Trench by man power

Can not use excavators

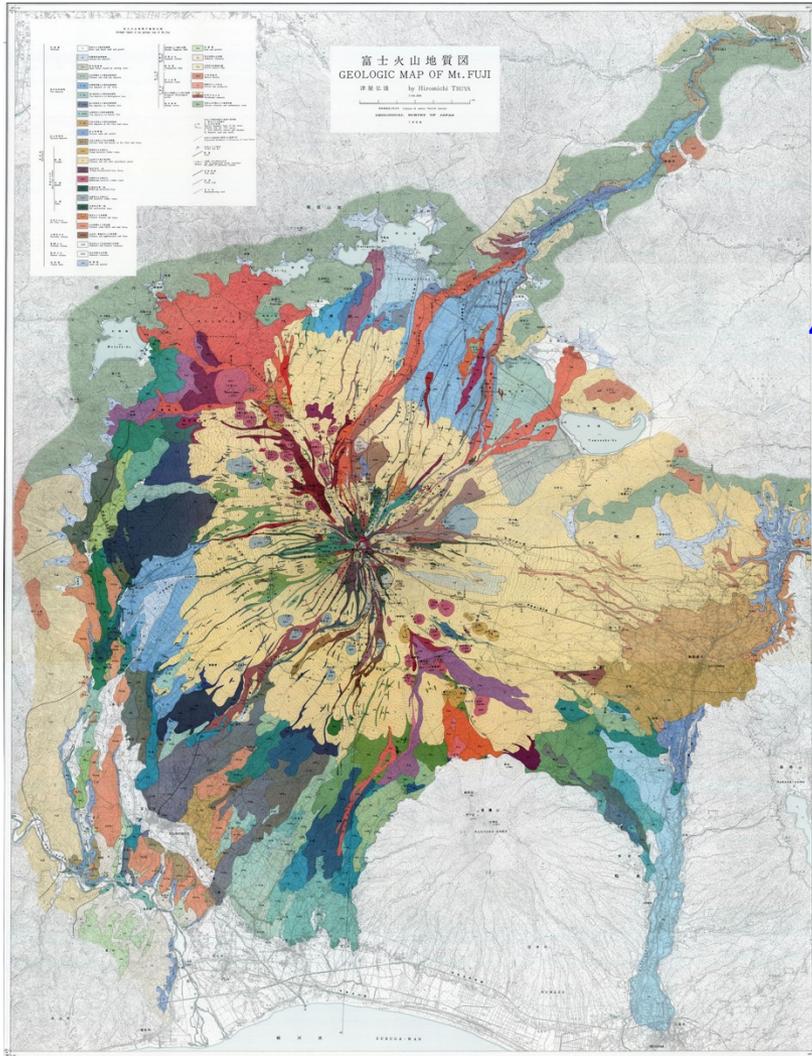

**Top of a scoria cone**

3.2m

**Excavating down to scoria cone deposits**

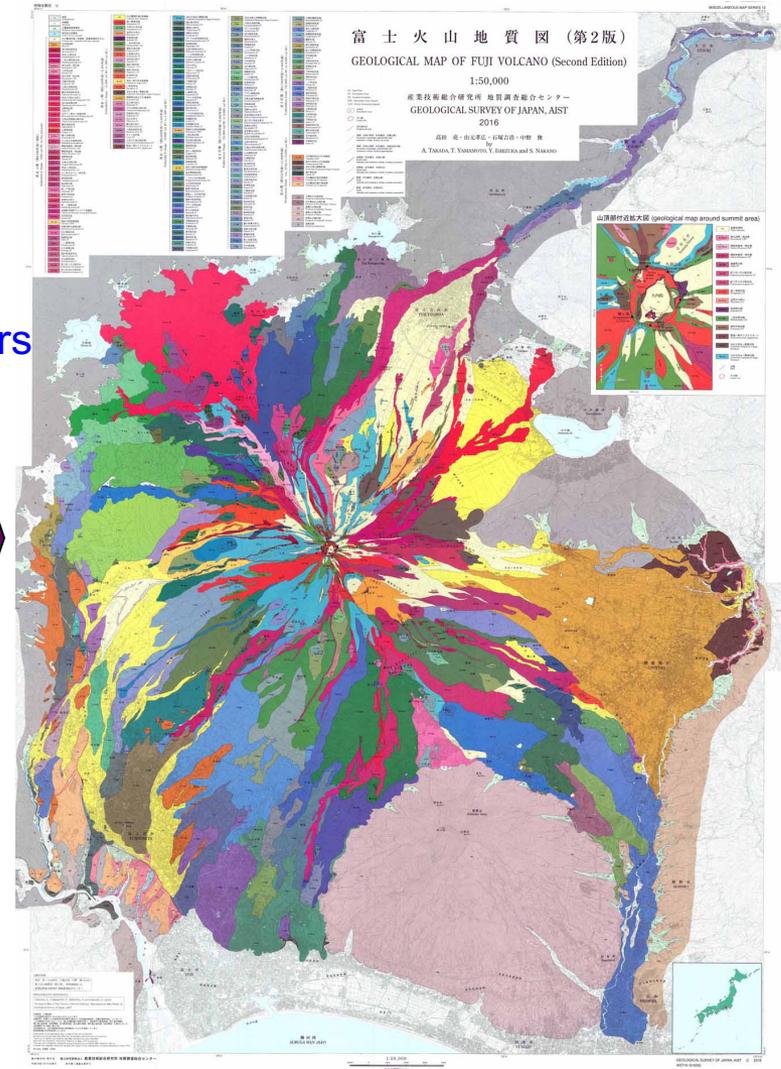

First Edition in 1968

48 years

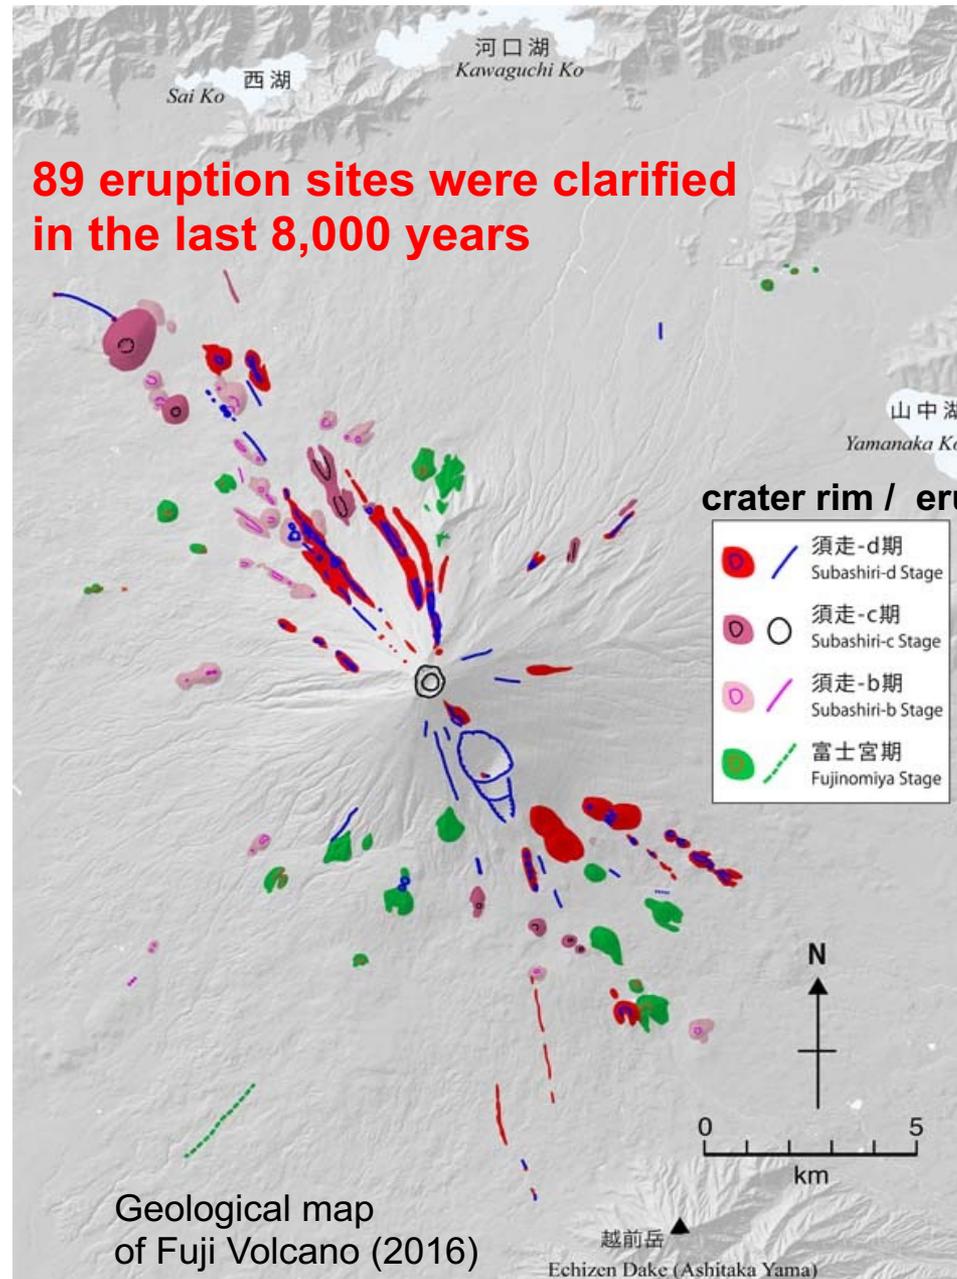

Second Edition in 2016

Used for hazard map revision

**89 eruption sites were clarified in the last 8,000 years**

**crater rim / eruption fissure**

- 須走-c期  
Subashiri-c Stage
- 須走-b期  
Subashiri-b Stage
- 富士宮期  
Fujinomiya Stage

**BC300-AD1707**  
**BC1500-BC300**  
**BC6000-BC1500**  
**BC15000-BC6000**

**Eruption sites, ages and scales were revised in this geological map, and local governments were reflecting it in hazard map revision in 2021.**

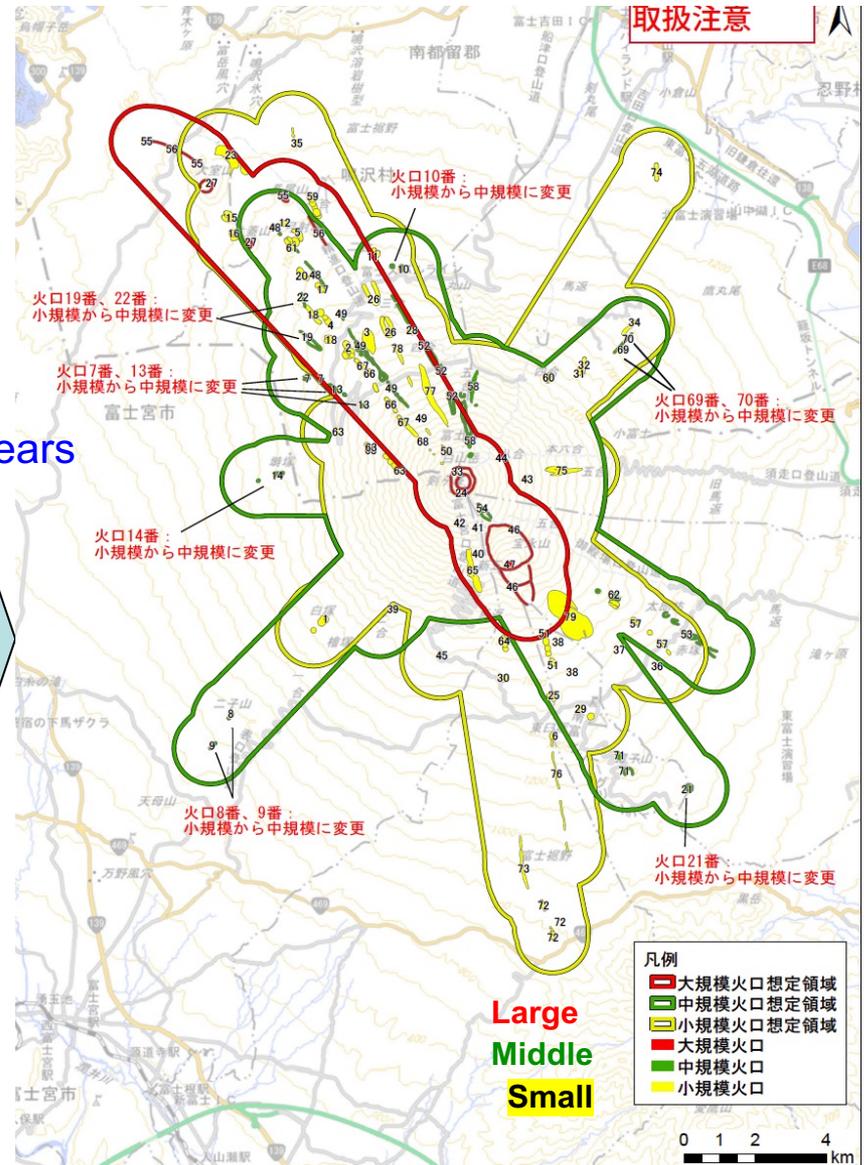

Geological map of Fuji Volcano (2016)

Assumed crater area and eruption scale

Cabinet Office (2004)

17 years

Revised Hazard map of Fuji Volcano (2021)

Miyakonojo City (27km from volcano) : Two days after

**Volcanic ash more than 5 mm thick was accumulated in the city with a population of over 100,000.**

Volcanic ash and lapilli near volcano

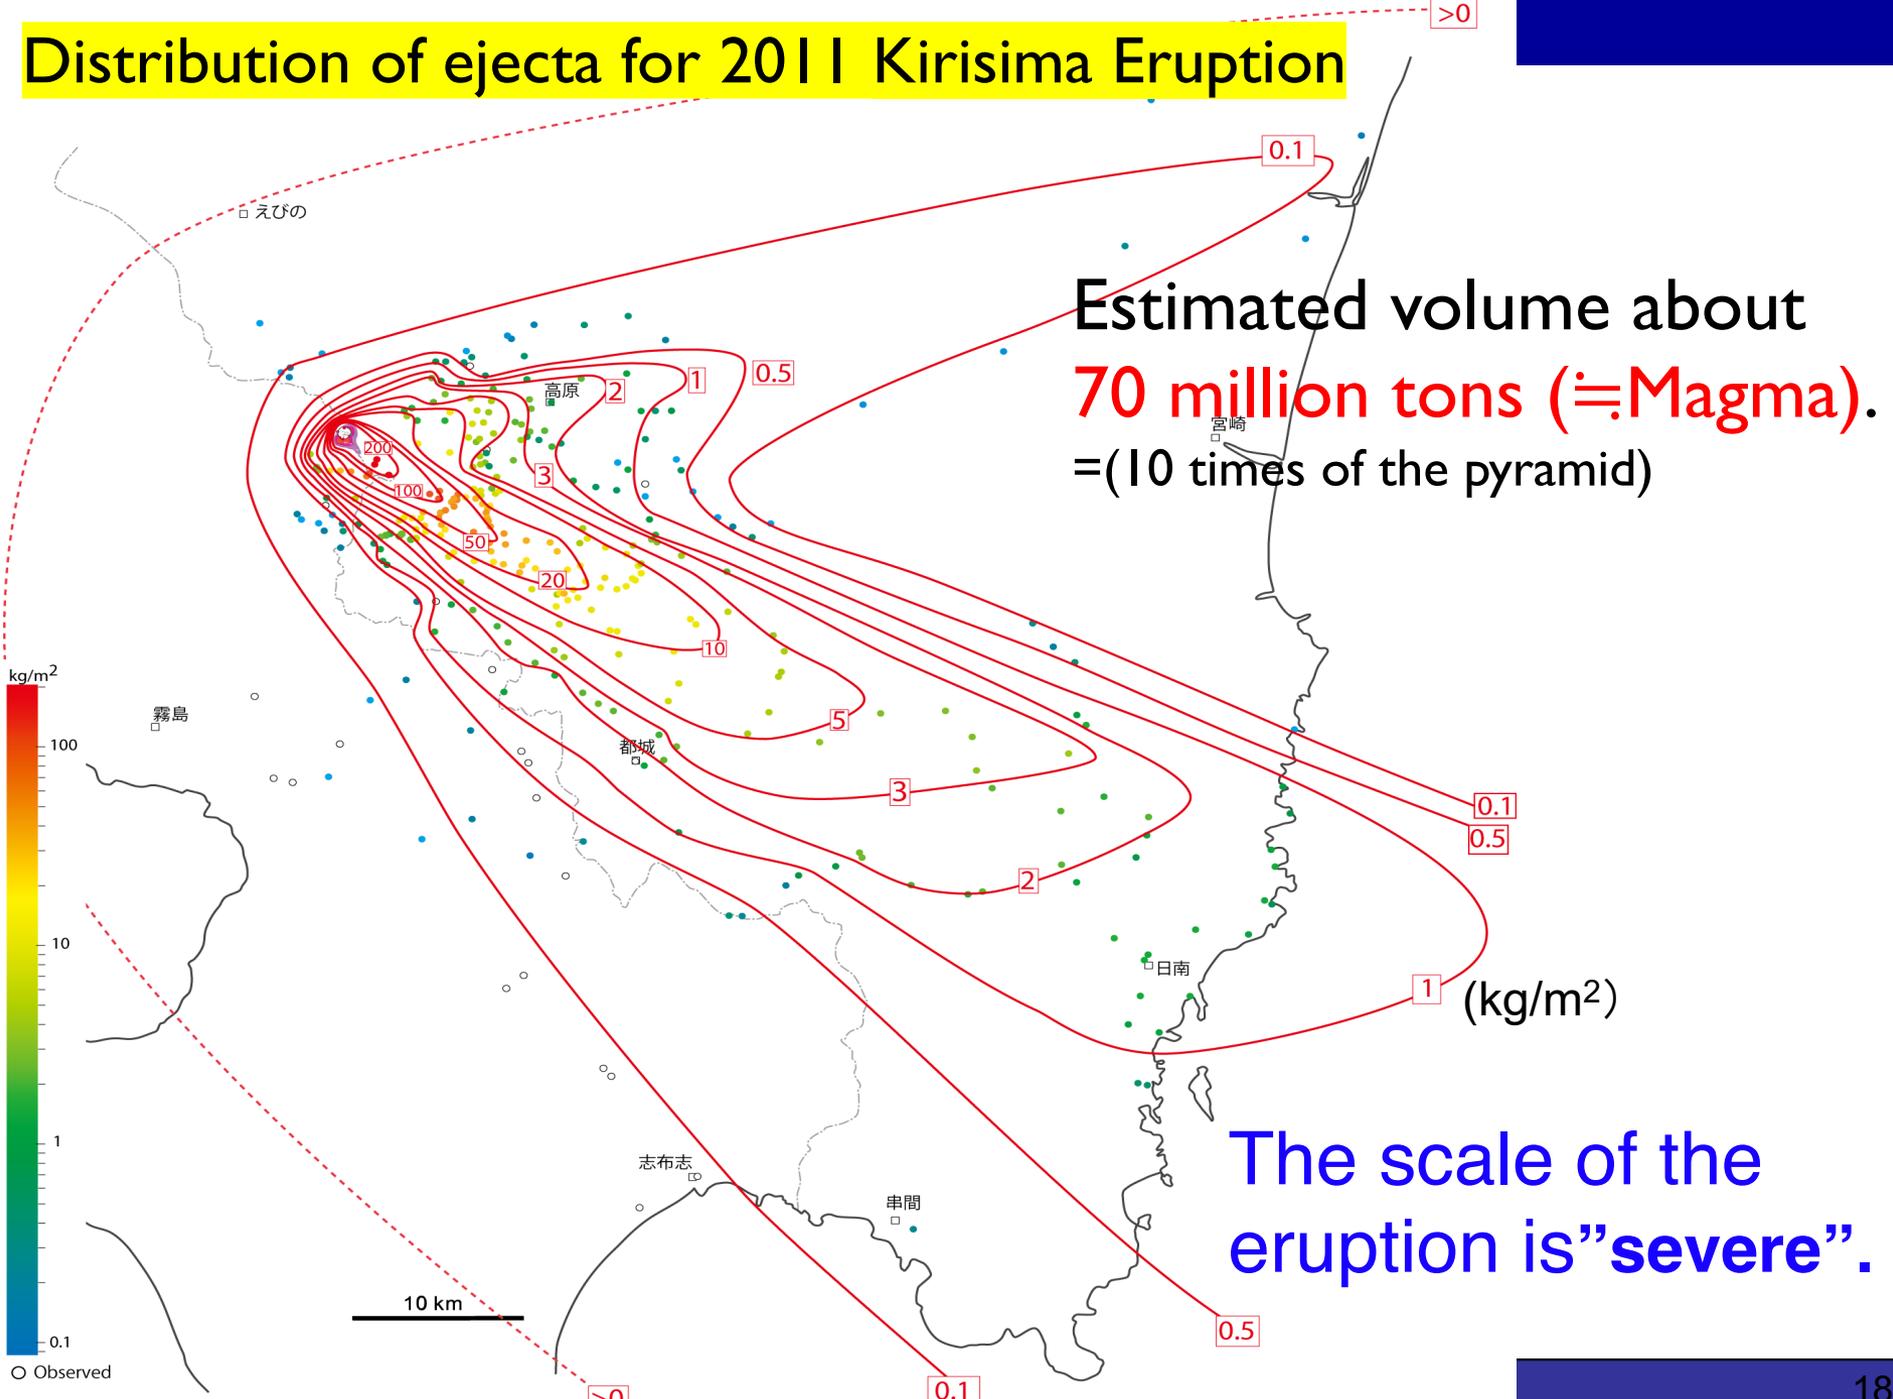

- ★ **Distribution survey**
  - How large is the eruption?
- ★ **Ejecta analysis**
  - Magmatic material involved?
  - What is the feature of magma?

## Evaluation of eruptive material

**Ballistic bombs (broken) and impact crater at proximal area (2km from crater)**

# Distribution of ejecta for 2011 Kirisima Eruption

Estimated volume about **70 million tons** ( $\approx$  Magma).  
=(10 times of the pyramid)

The scale of the eruption is "severe".

First survey around summits by volcanologists  
one month after the eruption.

64 hikers were lost by ballistic bombs  
(including missing)

Y.Ishizuka, GSJ, AIST

year	volcano	victims	cause	VEI
1, 2018	Kusatsu-Shirane	1 skier	ballistic bombs	1
2, 2014	Ontake	64 hiker	ballistic bombs	2
3, 1993	Unzen	1 local people	pyroclastic flow	1?
4, 1991	Unzen	43 journalist fireman etc.	pyroclastic flow	3
5, 1979	Aso	3 hiker	pyroclastic flow?	2
6, 1974	Niigata Yaketama	3 hiker	ballistic bombs	1
7, 1962	Tokachidake	5 mining worker	ballistic bombs	3
8, 1958	Aso	12 hiker	pyroclastic flow	1
9, 1955	Sakurajima	1 hiker	ballistic bombs	1
10, 1953	Aso	6 hiker	ballistic bombs	1?
11, 1952	Myojinsho	31 research vessel	phreatomagmatic explosion	?
12, 1950	Asama	1 hiker	ballistic bombs	1
13, 1947	Asama	9 hiker	ballistic bombs	1

Last 70 years, at least 180 were lost in Japan by volcanic eruptions

- **Sudden explosive eruption near crater (mostly phreatic eruption) causes fatal accidents**
- **Visiting people are sacrificed: Eruption alert system for visiting people is not fully provided.**

## Contribution to volcano disaster prevention based on geological mapping

- **Highly accurate geological mapping contributes to hazard maps that lead to the evacuation of residents.**
- **GSJ is using its knowledge of geological mapping to conduct emergency surveys at the eruptions. We provide data to the Japan Meteorological Agency and make the results available to the public and media.**

# Thank you
