

Geologic Maps Matter

Geologic maps provide critical information on surface and subsurface geology for economic sectors like real estate, infrastructure, critical mineral development, energy, and resource industries.

1

Geologic maps offer long-term savings

A single map can save companies and governments between **\$11,000** and **\$30,000** per project by eliminating the need to create critical data from scratch and avoiding costly mistakes.

2

Positive Long-Term Value

87% of respondents from the private sector view maps as having positive long-term value.

3

Funding

Continued federal and state funding is essential as geologic maps save money and reduce risks. However, the funding provided for geologic maps by both federal and state governments has not always been able to meet inflation.
