

Science to Reduce Landslide Risk

AGI Critical Issues Webinar

April 17, 2019

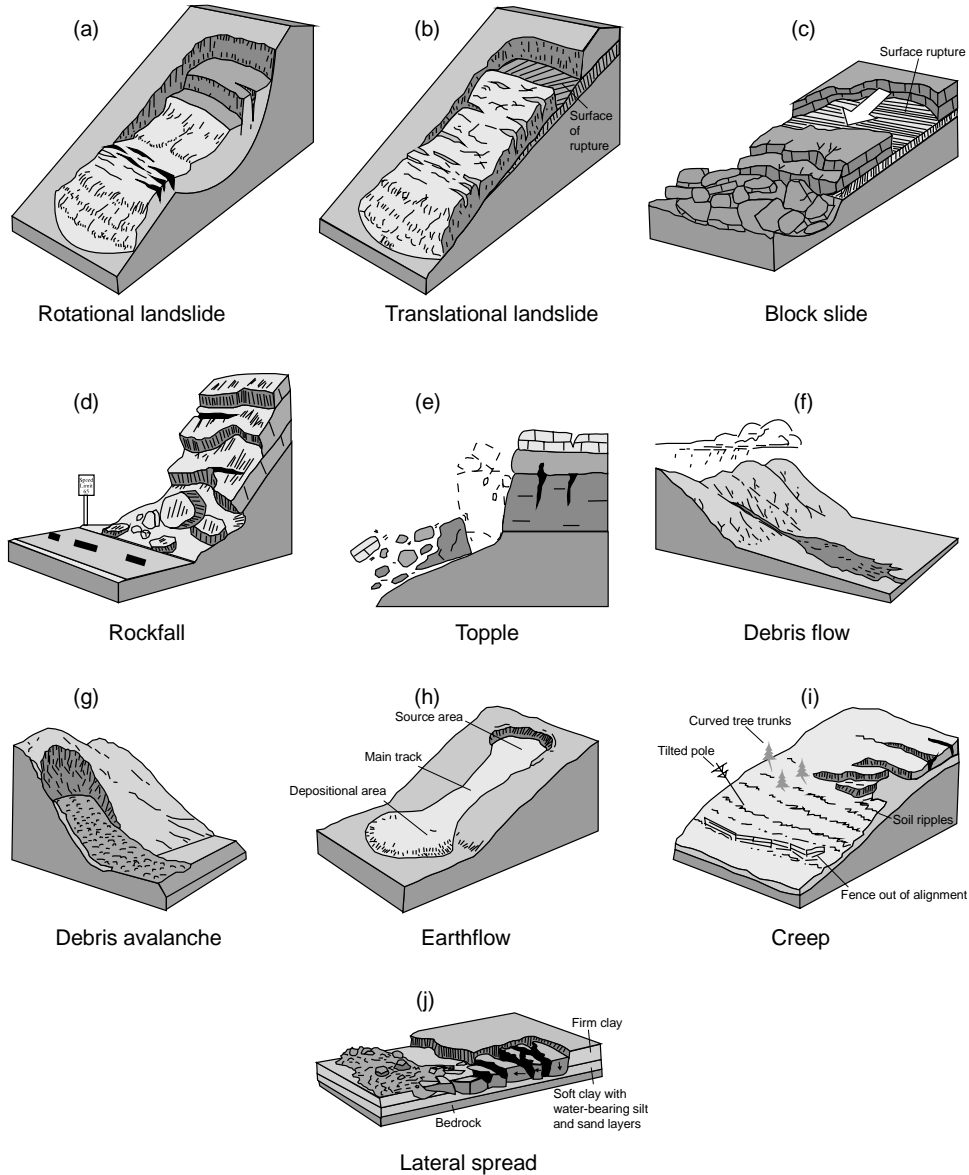

Jonathan Godt PhD

Acting Science Advisor for Earthquake and Geologic Hazards

jgodt@usgs.gov

<https://www.usgs.gov/natural-hazards/landslide-hazards>

Landslides are downslope movements of earth materials

Debris flows can be particularly destructive

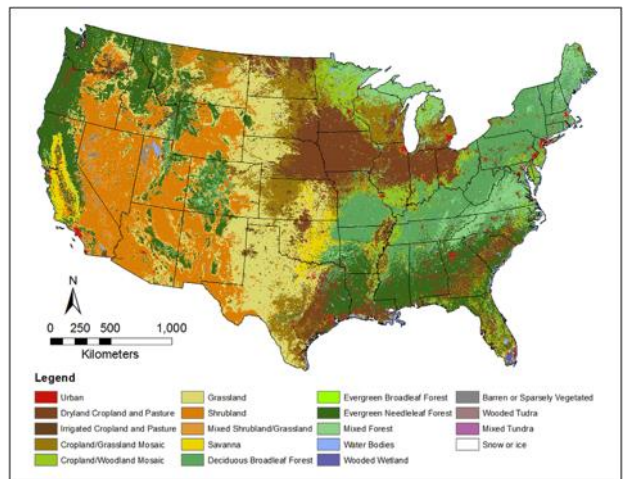

Hiroshima Prefecture, Japan, Photo: IBT

Landslide occurrence is influenced by:

Geology and topography

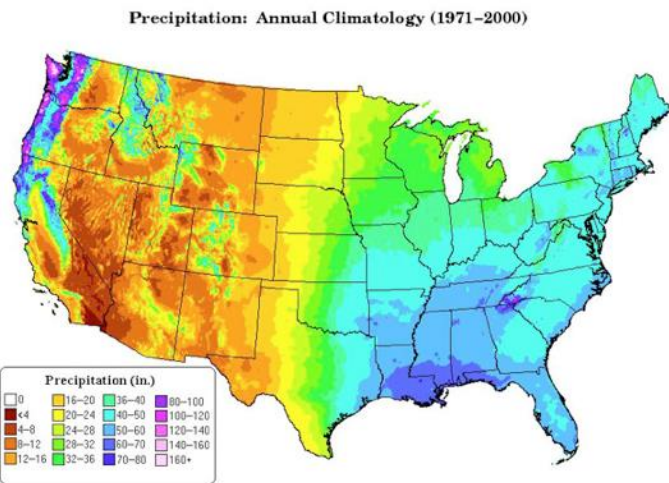

Land use – land cover – disturbance

Volcanic activity

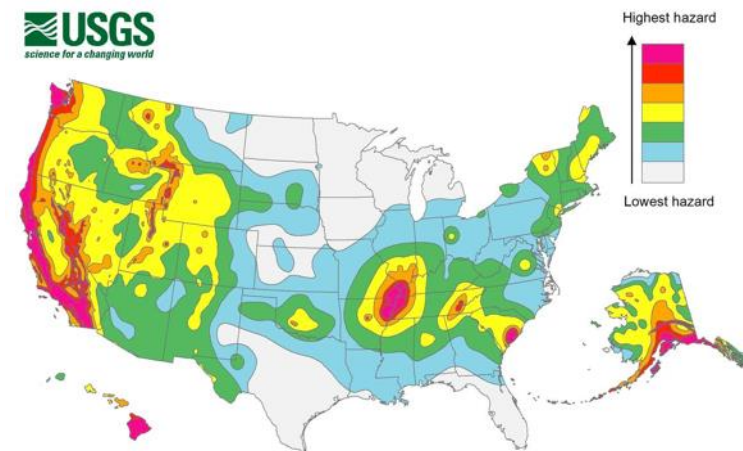

Climate

Wildfire

Active tectonics and earthquakes

Lidar technology has revolutionized landslide mapping

Find place or coordinates

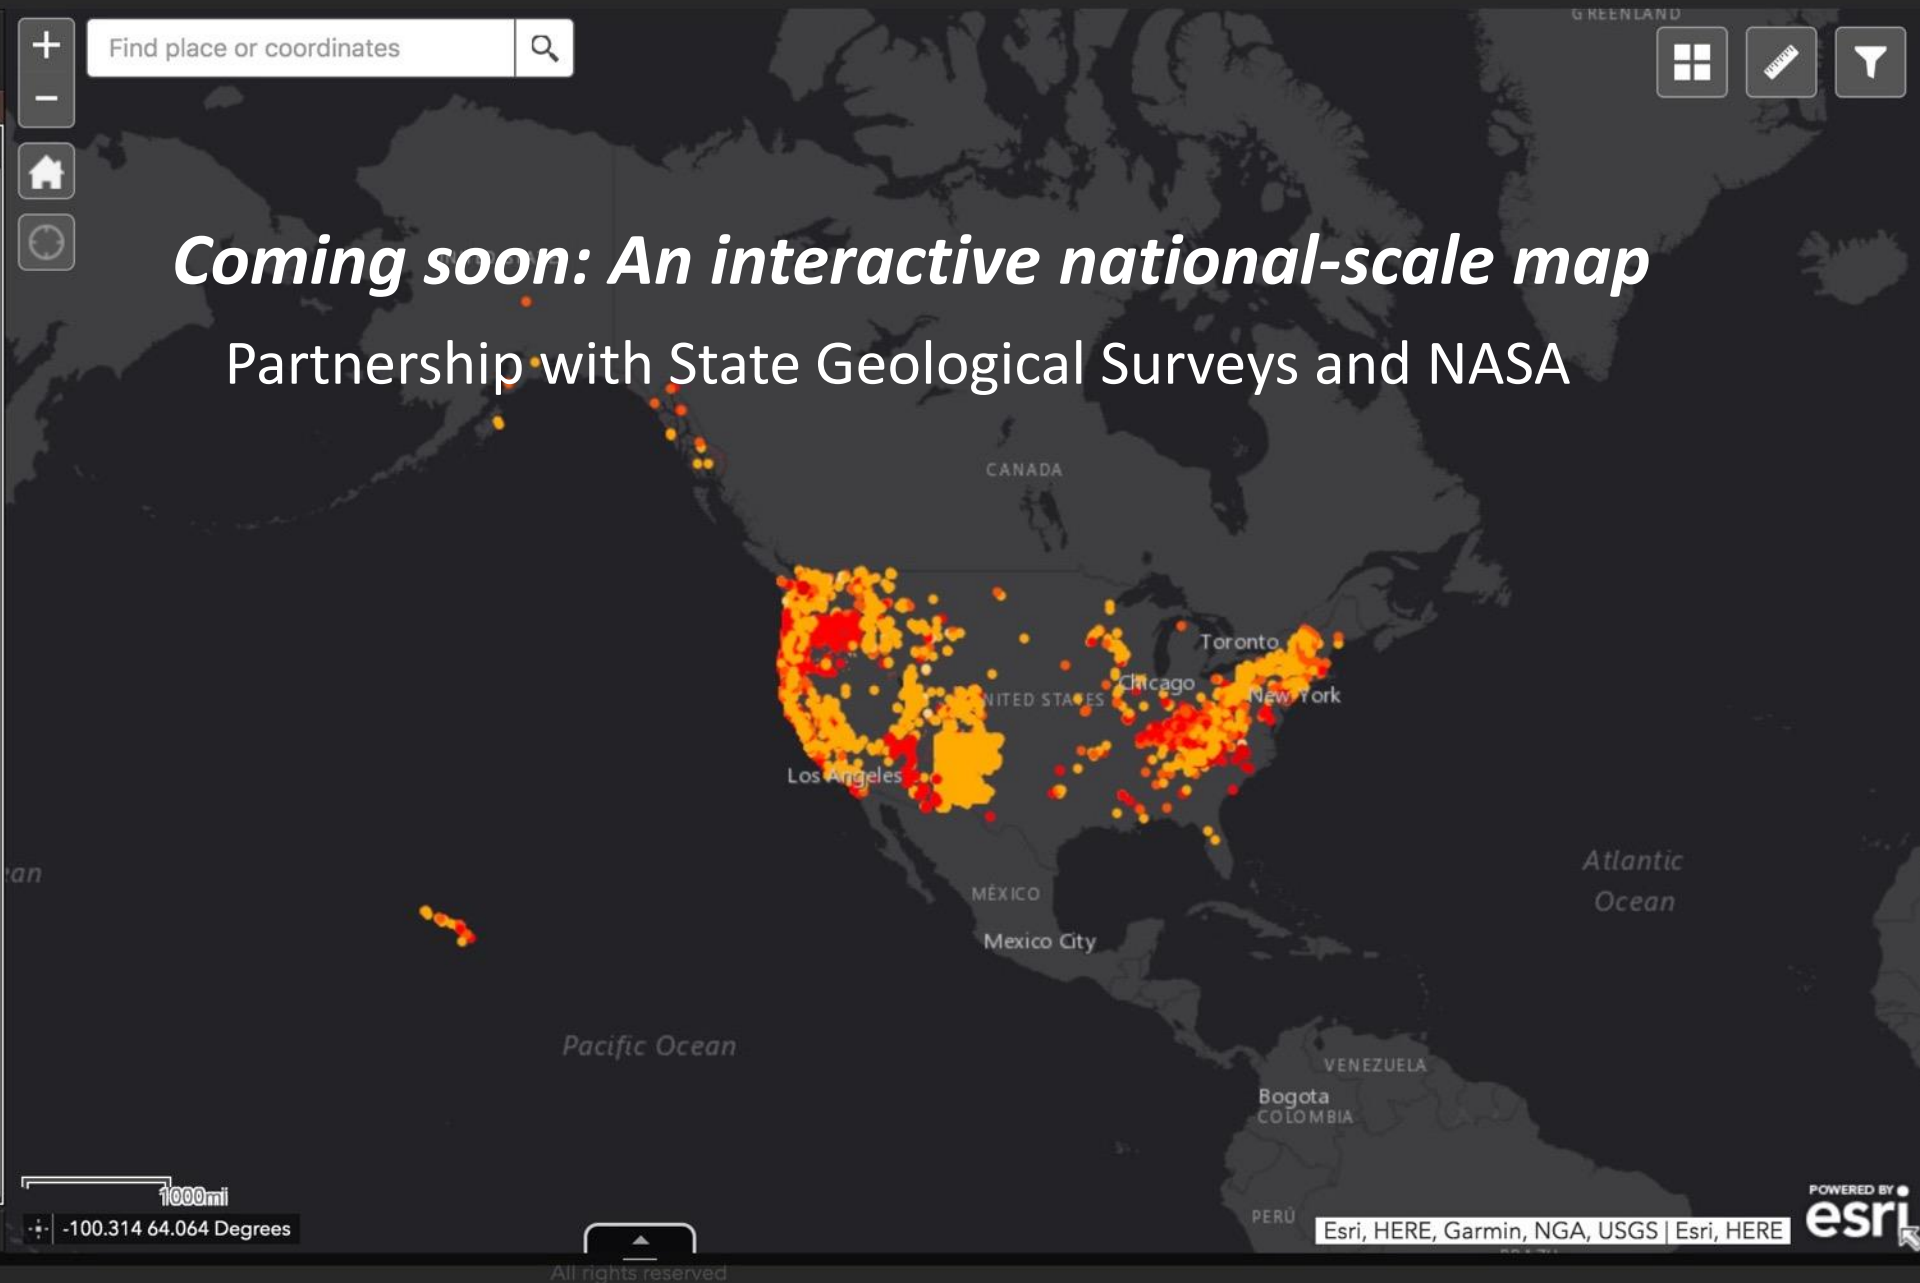

Legend

Landslide

Confidence

- High confidence in extent or nature of landslide (8)
- Confident consequential landslide at this location (5)
- Likely landslide at or near this location (3)
- Probable landslide in the area (2)
- Possible landslide in the area (1)

Coming soon: An interactive national-scale map

Wildfire

More erosion

Less infiltration

Intense rainfall can create destructive debris flows

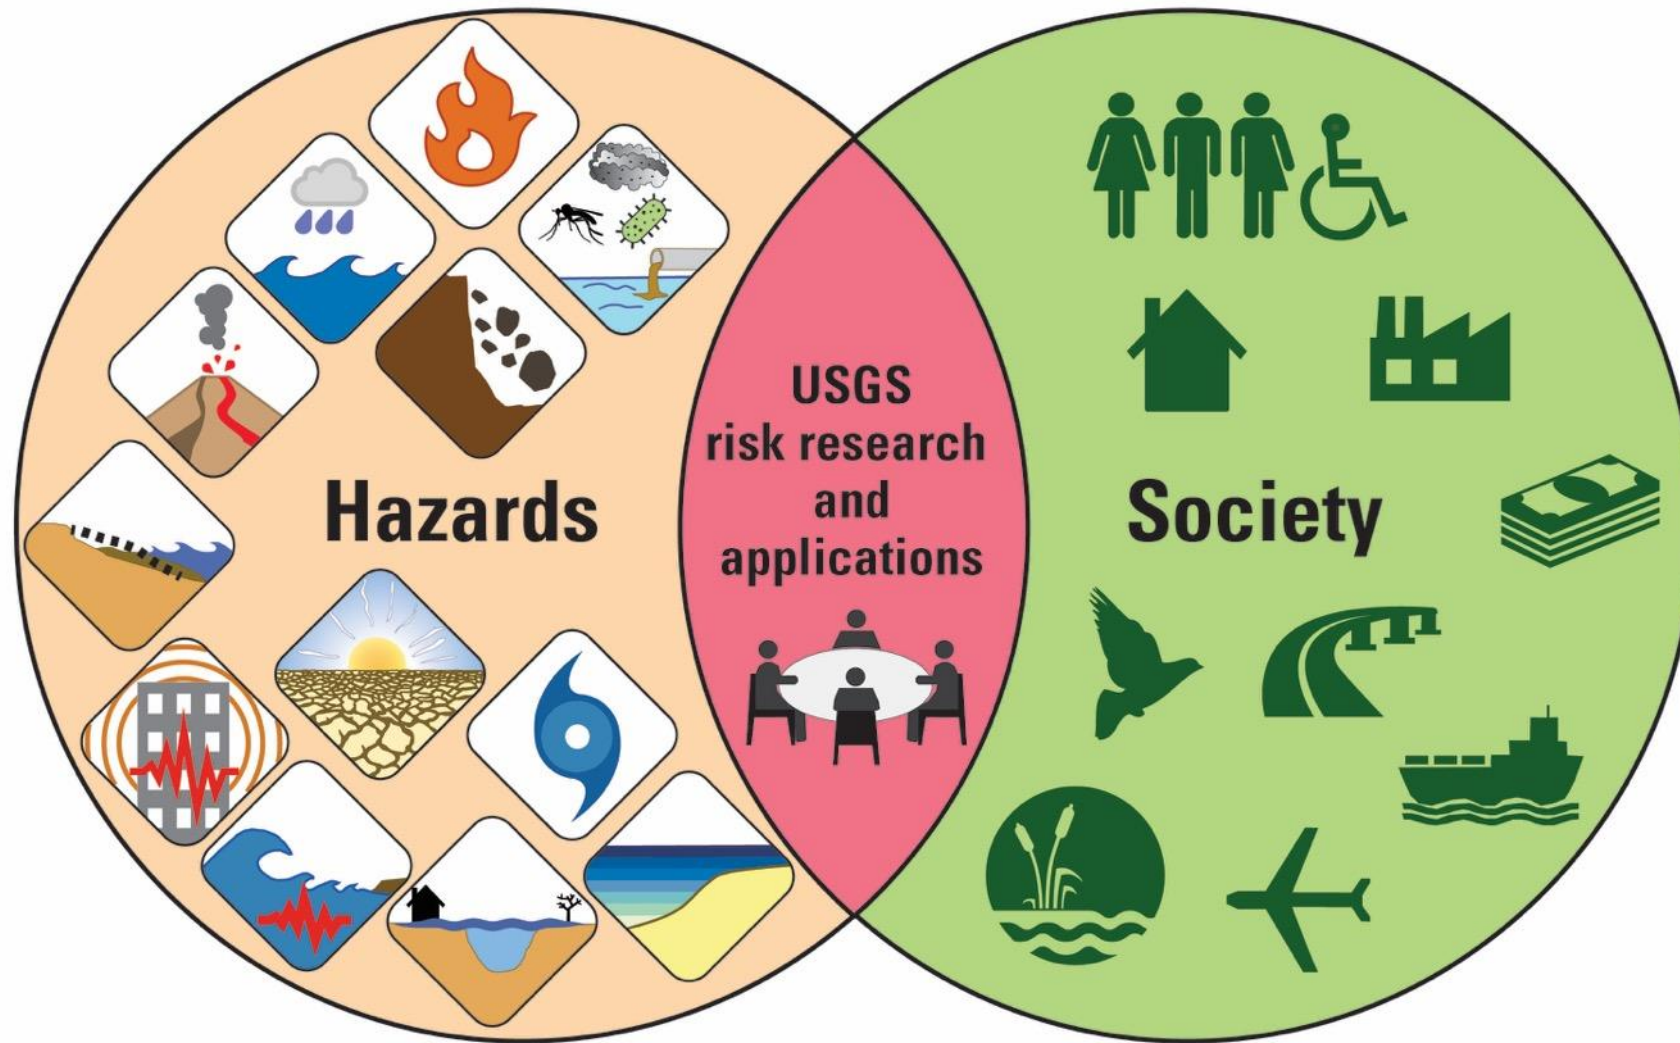

January 9, 2018 Montecito, CA Debris-Flows

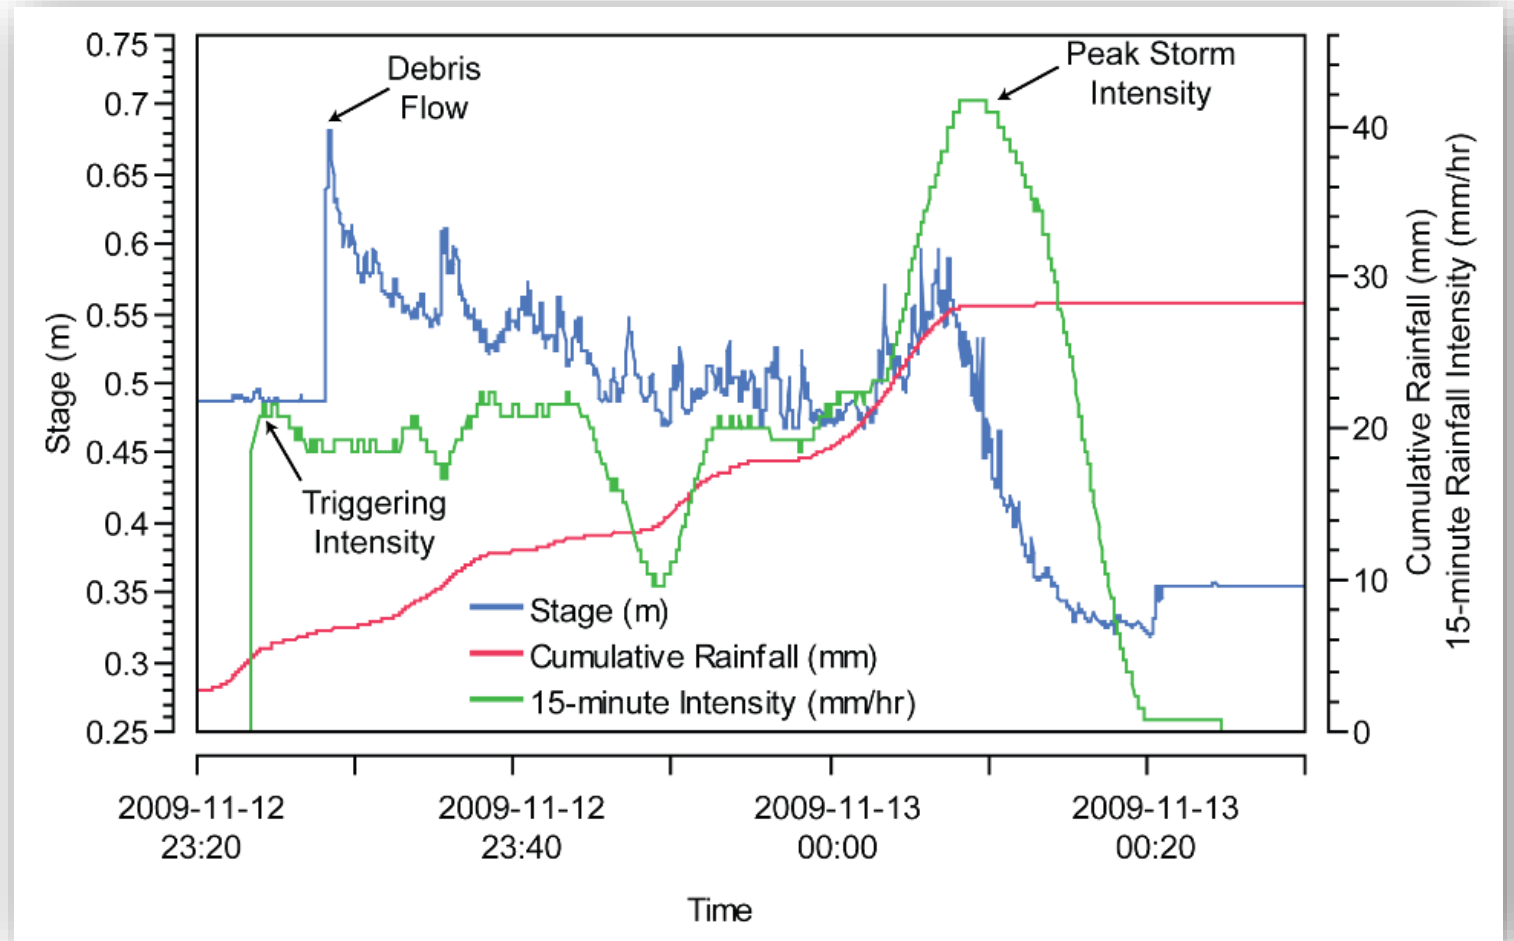

- Largest post-fire losses since 1934
- 23 Deaths
- 400+ damaged or destroyed homes

Science for a Risky World: a USGS Plan for Risk Research and Applications

To serve as the analytical foundation upon which decision makers can make more informed risk decisions in a dynamic and uncertain world

Science guides debris-flow risk reduction strategies

USGS role in post-fire debris-flow risk

Debris flow hazard maps and rainfall thresholds help emergency managers plan for post-fire impacts

Not yet addressed

Where?

What drainages are most susceptible?

Probability model

How big?

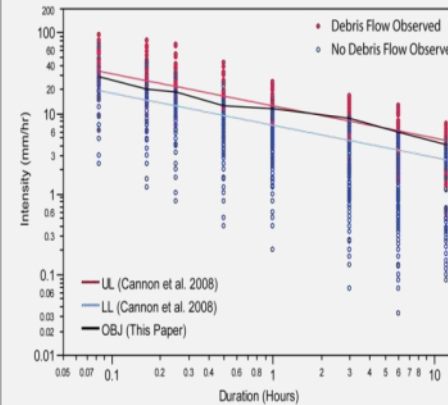

How large will the flows be?

Volume model

When?

How much rain will it take?

Rainfall criteria

How far?

Where will the flow go?

Inundation model

Living on the Real World

Policy challenge #1: Risk-reduction that emphasizes appropriate land-use, rigorous building codes, and resilient infrastructure, **minimizing interruption to people's lives and livelihoods.**

Policy challenge #2: Social trends such as urbanization, globalization of commerce and food security, and dependence on critical infrastructure operate on time scales that are **short relative to the return period of extreme events.** Risk reduction requires innovation to forestall increasing societal vulnerability from those trends.

Policy challenge #3: Framework that allows public, private, and academic sectors to **collaborate** in building a resilient society.

William H. Hooke, American Meteorological Society (Livingontherealworld.org)
